

COVID 19: THE CHALLENGING PATHWAY OF SARS-COV-2/COVID-19 MANAGEMENT

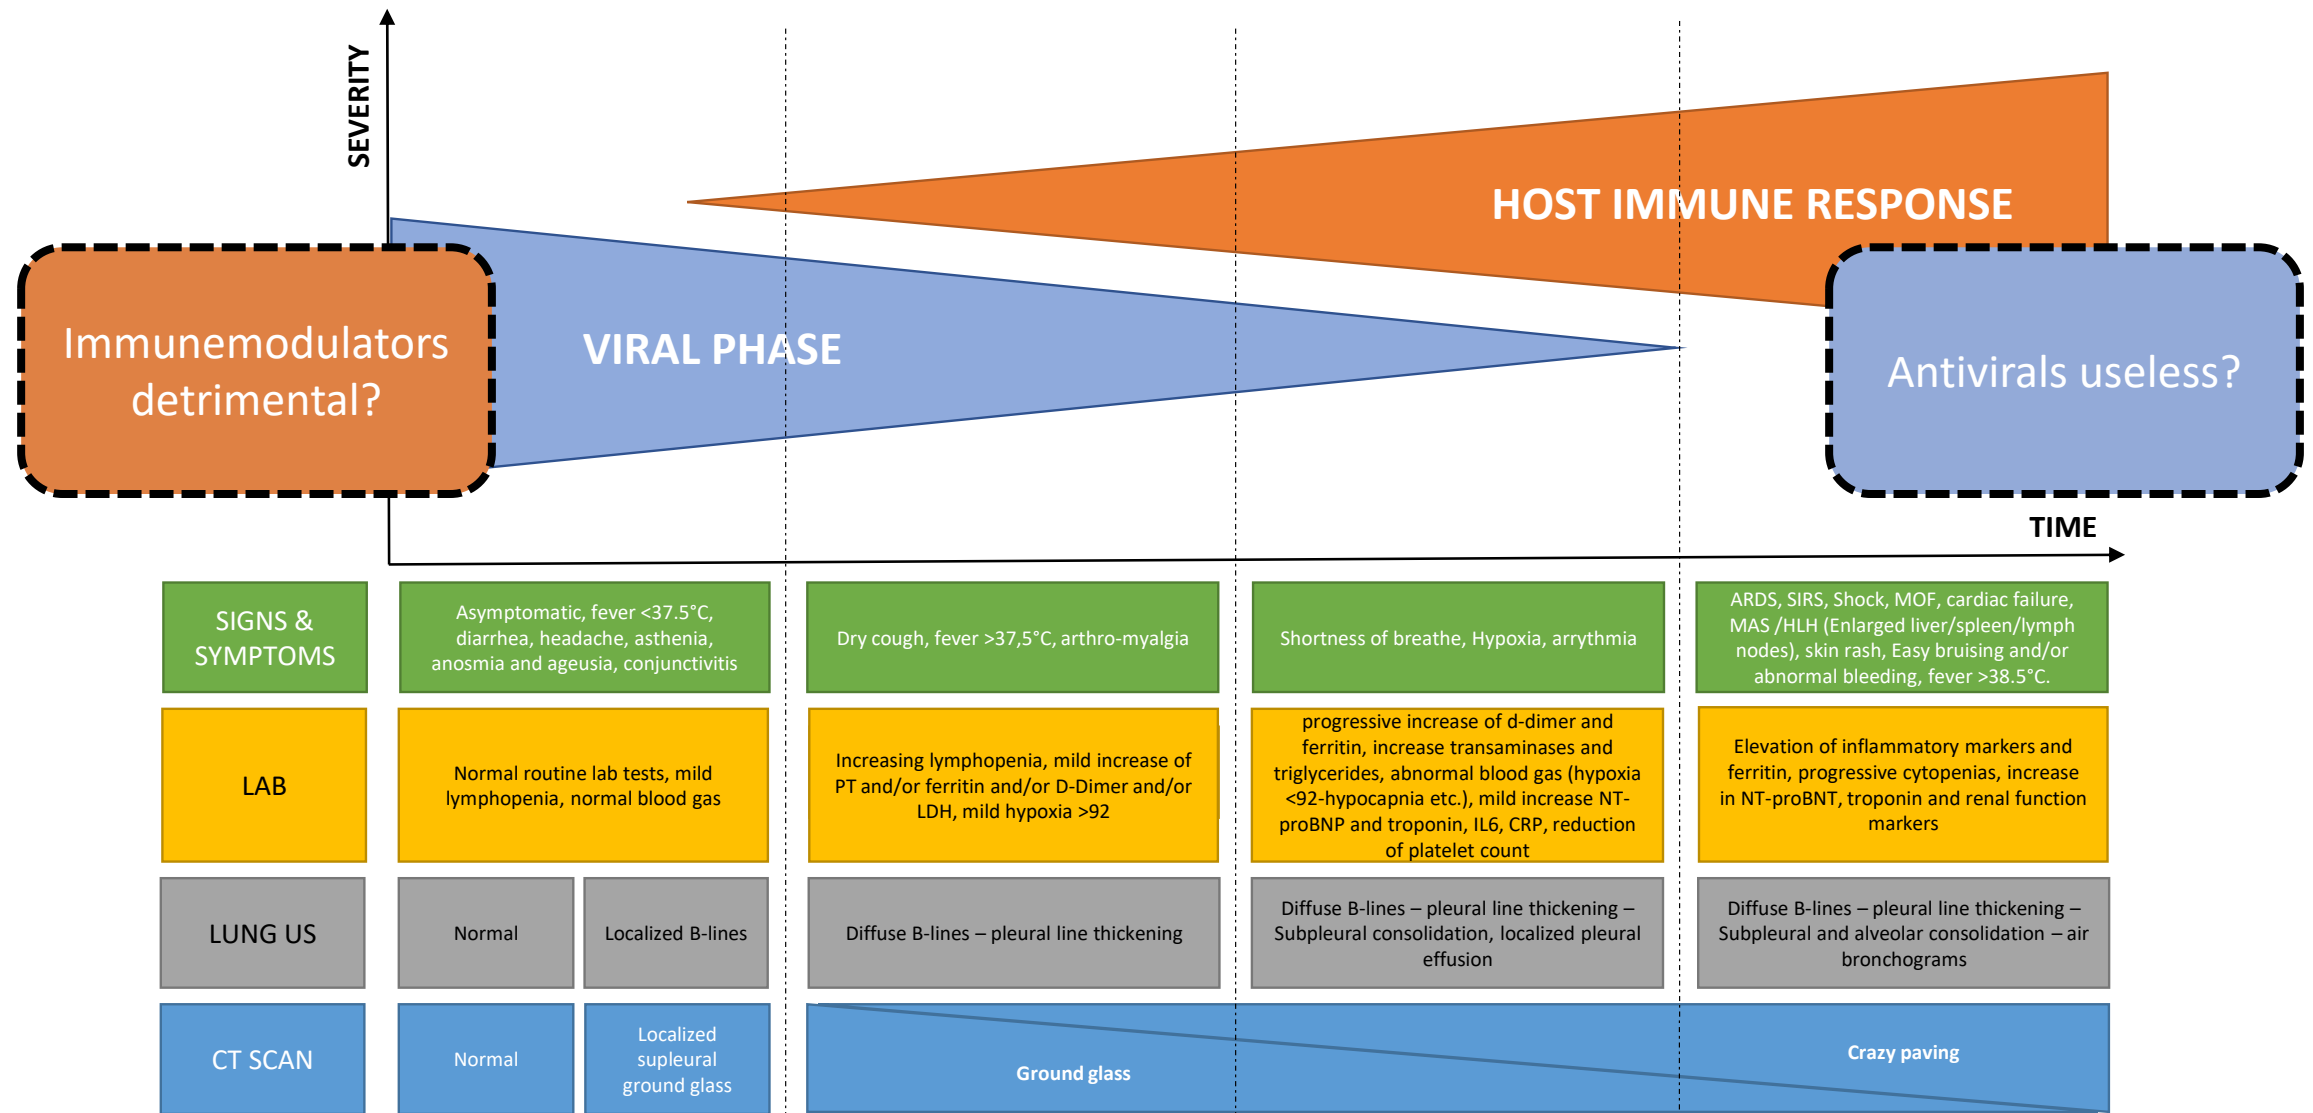

Immune modulation

Andrea Calcagno
University of Torino, Italy

Potential Conflict of Interest

I have read and understood ICMJE policy on declaration of interest
and I declare that in the past five years

- My Institution has received research grants from Abbvie, Gilead, BMS, Janssen-Cilag and ViiV;
- I received speaker's and consultancy honoraria from Gilead, Insmed, Janssen-Cilag, MSD and ViiV.

Immune abnormalities

From the point of view of rheumatologists, except for respiratory failure, the critical COVID-19 patients have common features:

- 1) sudden deterioration of disease around one to two weeks after onset;
- 2) much lower level of **lymphocytes**, especially natural killer (NK) cells in peripheral blood;
- 3) **extremely high inflammatory** parameters, including C reactive protein (CRP) and pro-inflammatory cytokines (IL-6, TNF α , IL-8, et al);
- 4) destroyed immune system revealed by **atrophy of spleen and lymph nodes**, along with reduced lymphocytes in lymphoid organs;
- 5) the majority of **infiltrated immune cells in lung lesion are monocytes and macrophages**, but minimal lymphocytes infiltration;
- 6) mimicry of **vasculitis, hypercoagulability and multiple organs damage**.

Cytokine release syndrome

Bradykinin storm syndrome

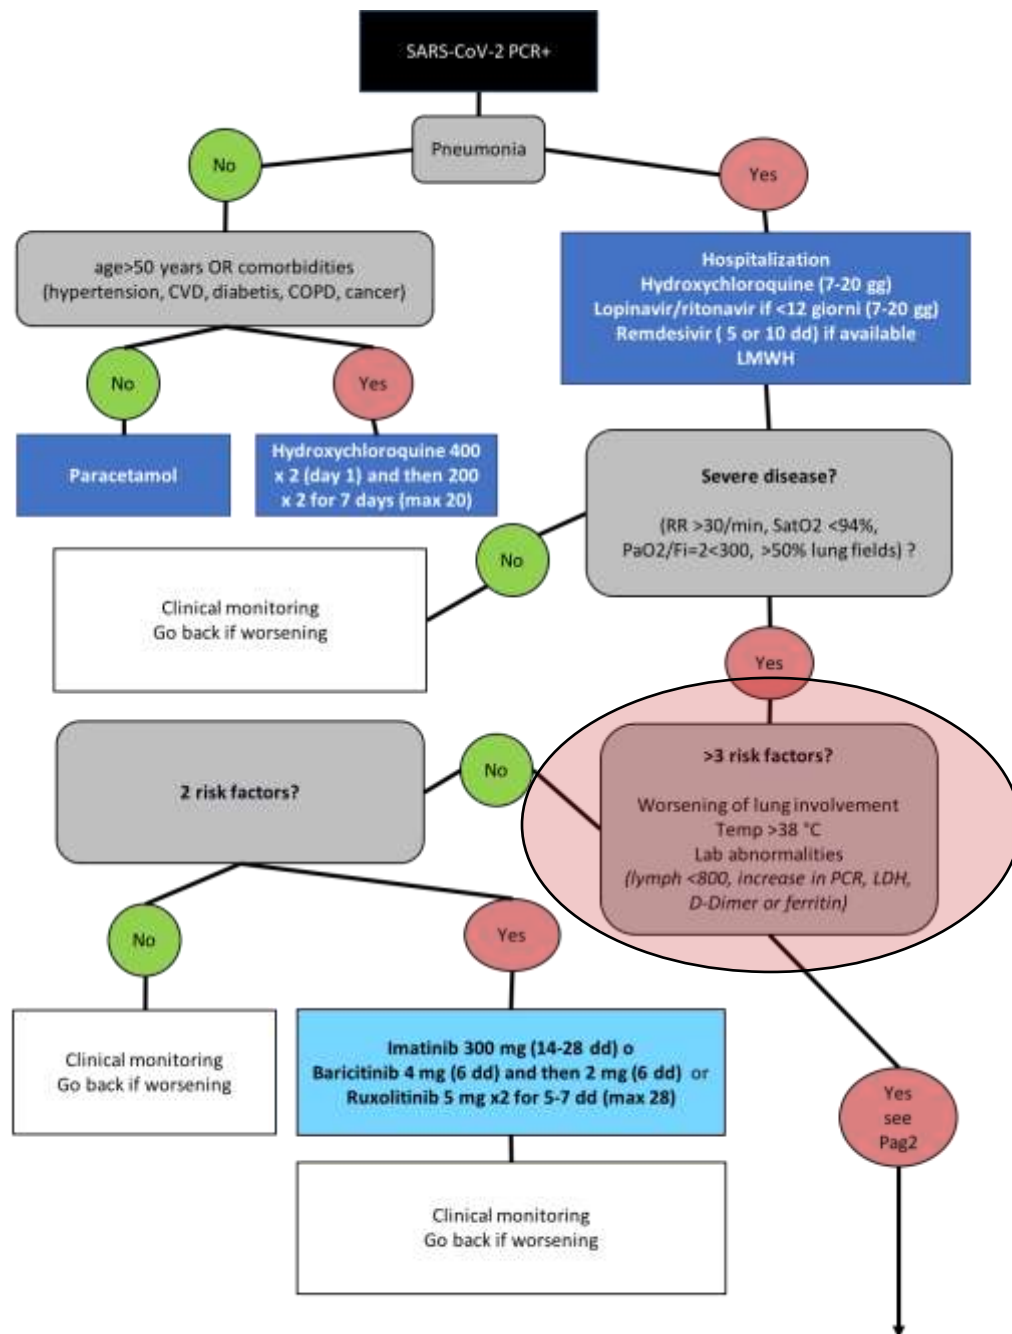

therapeutics

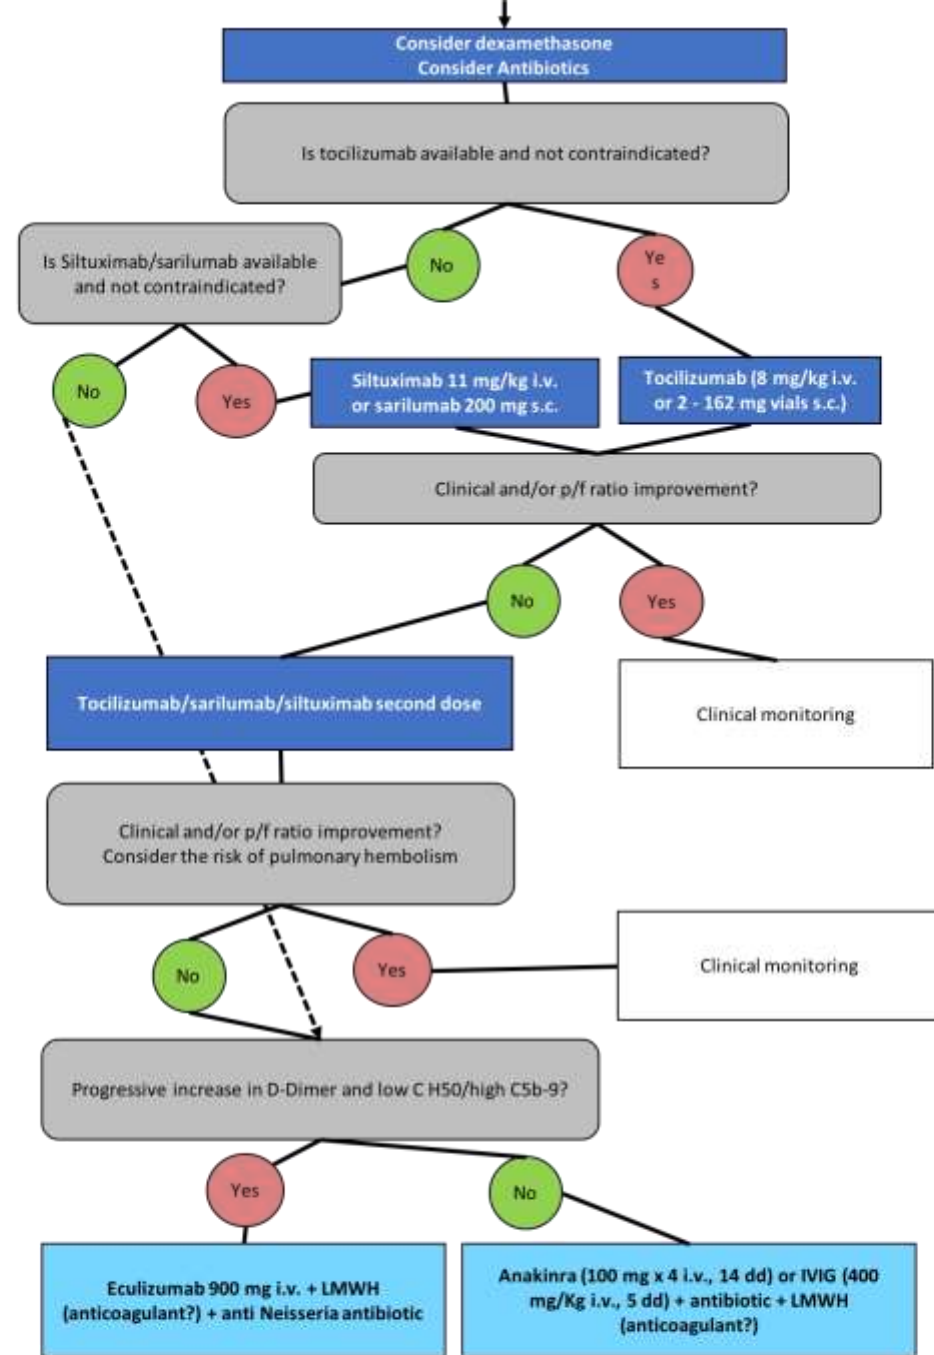

Immune modulators

- Corticosteroids
- Tocilizumab
- Sarilumab
- Siltuximab
- Baricitinib
- Ruxolitinib
- Imatinib
- Thalidomide
- IGIV
- Eculizumab
- Anakinra

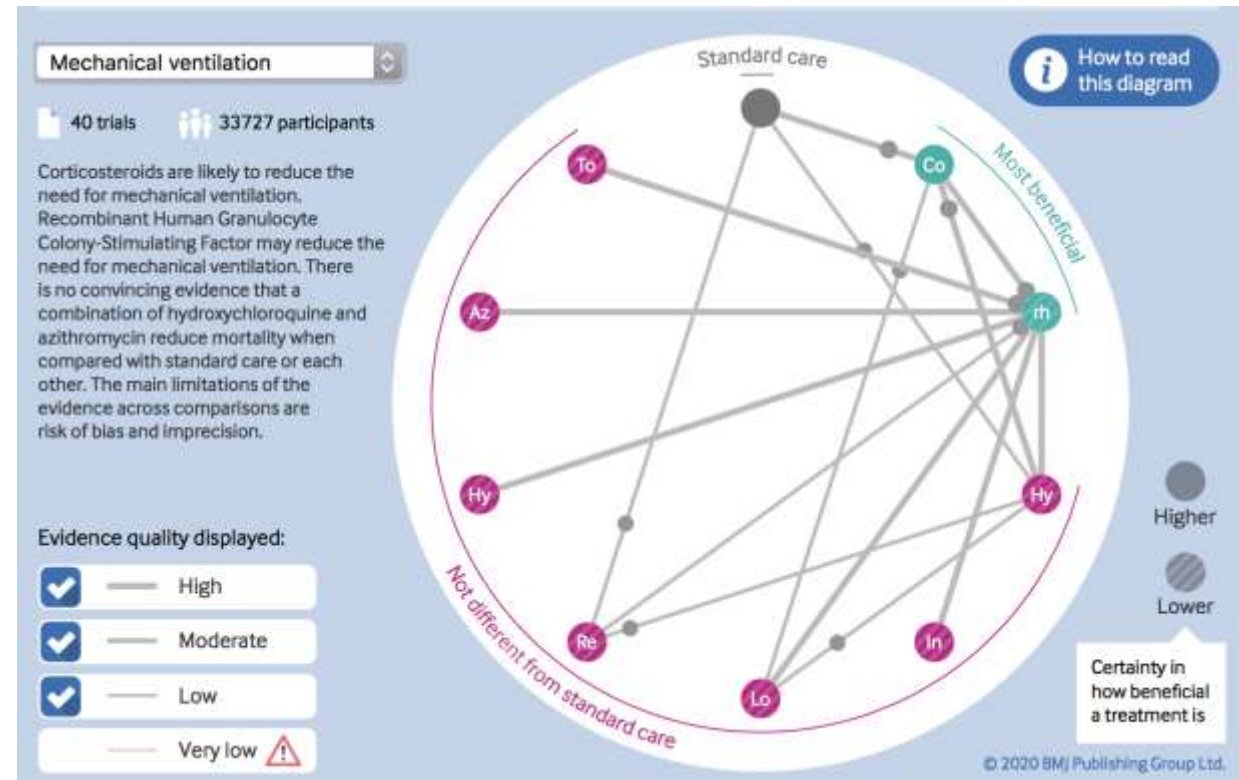

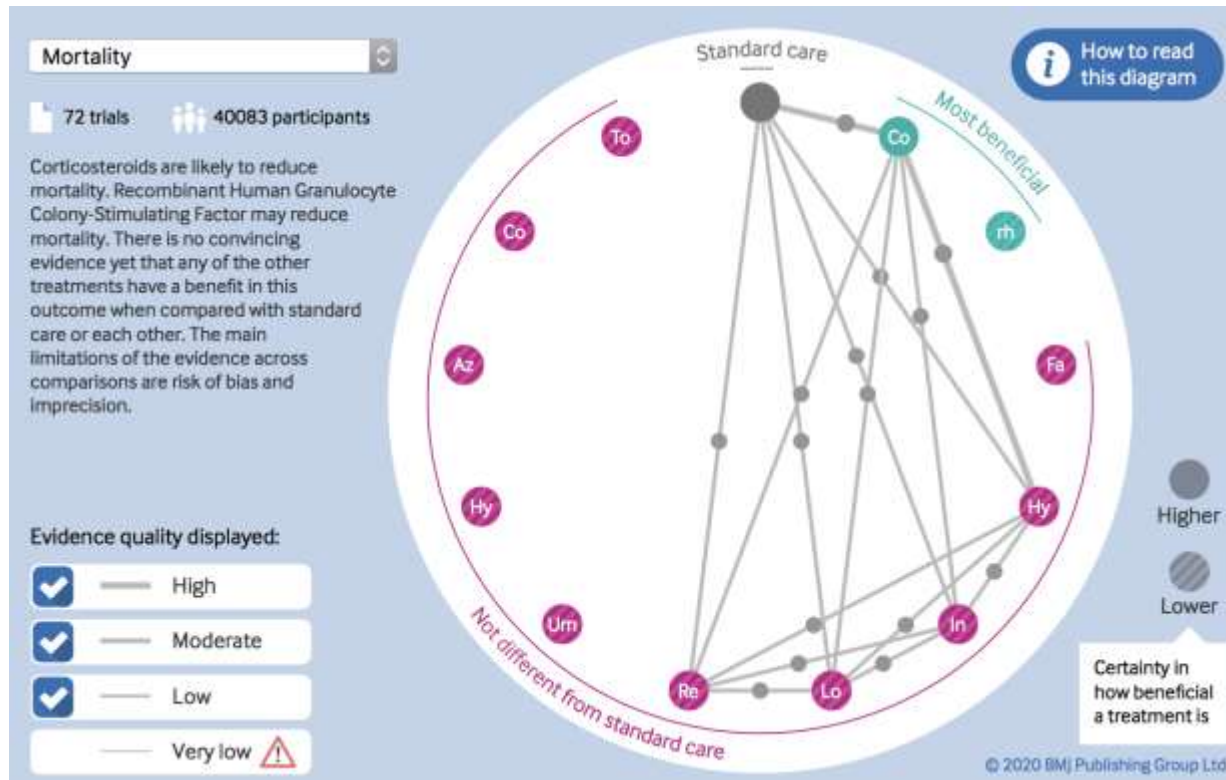

Treatment in light blue boxes are based on expert opinions and patients have to be enrolled in clinical studies

Corticosteroids

Dexamethasone in Hospitalized Patients with Covid-19 — Preliminary Report

The RECOVERY Collaborative Group*

A All Participants (N=6425)

| No. at Risk | | | | | |
|---------------|------|------|------|------|------|
| Usual care | 4321 | 3754 | 3427 | 3271 | 3205 |
| Dexamethasone | 2104 | 1903 | 1725 | 1659 | 1621 |

B Invasive Mechanical Ventilation (N=1007)

| No. at Risk | | | | | |
|---------------|-----|-----|-----|-----|-----|
| Usual care | 683 | 572 | 481 | 424 | 400 |
| Dexamethasone | 324 | 290 | 248 | 232 | 228 |

C Oxygen Only (N=3883)

| No. at Risk | | | | | |
|---------------|------|------|------|------|------|
| Usual care | 2604 | 2195 | 2018 | 1950 | 1916 |
| Dexamethasone | 1279 | 1135 | 1036 | 1006 | 981 |

D No Oxygen Received (N=1535)

| No. at Risk | | | | | |
|---------------|------|-----|-----|-----|-----|
| Usual care | 1034 | 987 | 928 | 897 | 889 |
| Dexamethasone | 501 | 478 | 441 | 421 | 412 |

- 2104 vs. 4321
- Oral or iv dexamethasone 6 mg/day up to 10 days (median 7 days, IQR 3-10)

Respiratory Support at Randomization

| | Dexamethasone <i>no. of events/total no. (%)</i> | Usual Care <i>no. of events/total no. (%)</i> | Rate Ratio (95% CI) |
|---------------------------------|---|--|-------------------------|
| Invasive mechanical ventilation | 95/324 (29.3) | 283/683 (41.4) | 0.64 (0.51–0.81) |
| Oxygen only | 298/1279 (23.3) | 682/2604 (26.2) | 0.82 (0.72–0.94) |
| No oxygen received | 89/501 (17.8) | 145/1034 (14.0) | 1.19 (0.91–1.55) |
| All Patients | 482/2104 (22.9) | 1110/4321 (25.7) | 0.83 (0.75–0.93) |

Chi-square trend across three categories: 11.5

Table 2. Primary and Secondary Outcomes.

| Outcome | Dexamethasone (N=2104) | Usual Care (N=4321) | Rate or Risk Ratio (95% CI)* |
|---|---------------------------|------------------------|---------------------------------|
| <i>no./total no. of patients (%)</i> | | | |
| Primary outcome | | | |
| Mortality at 28 days | 482/2104 (22.9) | 1110/4321 (25.7) | 0.83 (0.75–0.93) |
| Secondary outcomes | | | |
| Discharged from hospital within 28 days | 1413/2104 (67.2) | 2745/4321 (63.5) | 1.10 (1.03–1.17) |
| Invasive mechanical ventilation or death† | 456/1780 (25.6) | 994/3638 (27.3) | 0.92 (0.84–1.01) |
| Invasive mechanical ventilation | 102/1780 (5.7) | 285/3638 (7.8) | 0.77 (0.62–0.95) |
| Death | 387/1780 (21.7) | 827/3638 (22.7) | 0.93 (0.84–1.03) |

Corticosteroids: other RCTs

Early STOP after
RECOVERY data

METCOVID (Jeronimo, CID)

194 vs. 199, hospitalized
Methylprednisolone 0.5 mg/Kg x 2 for 5 days
No effect on mortality (Yes in those aged >60)
More insulin needed

CoDex (Tomazini, JAMA)

151 vs. 148, ARDS
Dexamethasone 20 mg (dd 1-5) and 10 mg (dd 6-10)
No effect on mortality but more ventilator-free days
More secondary infections, insulin and Aes

CapeCOVID (Dequin, JAMA)

76 vs. 73, ICU
Hydrocortisone 200 mg for 7 days and then ↓
No effect on death/persistent respiratory support

REMACAP-CAP (JAMA)

137 vs. 146 vs. 101, ICU
Hydrocortisone 50/100 x 4 for 7 dd vs. shock-dependant vs. SOC
Higher probability of improvement (no effect on mortality)

Association Between Administration of Systemic Corticosteroids and Mortality Among Critically Ill Patients With COVID-19

A Meta-analysis

The WHO Rapid Evidence Appraisal for COVID-19 Therapies (REACT) Working Group

REVIEW

Rationale and evidence on the use of tocilizumab in COVID-19: a systematic review

A. Cortegiani^{a,*}, M. Ippolito^a, M. Greco^{b,c}, V. Granone^{b,c}, A. Protti^{b,c}, C. Gregoretto^{a,d},
A. Giarratano^a, S. Einav^e, M. Cecconi^{b,c}

- Although many of the patients included in these studies had severe or critical disease and many were admitted to ICUs, **drawing conclusions from the findings of these studies is a leap of faith, given that most had small sample sizes and high or moderate risk of bias, mostly due to confounding.**
- The identified studies also varied in dosing (single or double), and drug availability issues emerged in some centres, which may have influenced both sample sizes and study designs.
- Regarding the timing of drug administration, that could therefore potentially determine treatment outcomes, a pre-print study evaluated the effect of early vs late administration of the drug on the outcomes, but the association remains unclear and understudied. The authors found that for each additional day of delay from the admission to tocilizumab administration, the odds of receiving mechanical ventilation independently increase by 21% (95% CI: [1.08, 1.38], $p = 0.002$).
- Clinical studies on patients with COVID-19 have also evoked some safety concerns. The risk of secondary infection complications is unclear.

Tocilizumab: RCTs (COVACTA)

- Iv Tocilizumab vs. Placebo plus SOC, randomised, double-blind, placebo-controlled phase III study, n=450
- Hospitalised adult patients with severe COVID-19 associated pneumonia
 - **Primary endpoint: 7-category ordinal scale clinical status**
 - **not met → (p=0.36; odds ratio [95% CI] = 1.19 [0.81, 1.76])**
 - No difference in mortality 19.7% vs. 19.4% → difference 0.3% [-7.6%, 8.2%], p=0.9410
 - Time to hospital discharge shorter in patients on toci (20 vs. 28 days, p=0.0370);
 - The difference in ventilator-free days was not statistically significant (22 vs. 16.5 days, p=0.3202);
 - Similar rates of infections (38.3% vs. 40.6%) and serious infections (21.0% vs. 25.9%).

ABSTRACT

BACKGROUND

Coronavirus disease 2019 (Covid-19) pneumonia is often associated with hyperinflammation. Despite the disproportionate incidence of Covid-19 among underserved and racial and ethnic minority populations, the safety and efficacy of the anti-interleukin-6 receptor antibody tocilizumab in patients from these populations who are hospitalized with Covid-19 pneumonia are unclear.

METHODS

We randomly assigned (in a 2:1 ratio) patients hospitalized with Covid-19 pneumonia who were not receiving mechanical ventilation to receive standard care plus one or two doses of either tocilizumab (8 mg per kilogram of body weight intravenously) or placebo. Site selection was focused on the inclusion of sites enrolling high-risk and minority populations. The primary outcome was mechanical ventilation or death by day 28.

RESULTS

A total of 389 patients underwent randomization, and the modified intention-to-treat population included 249 patients in the tocilizumab group and 128 patients in the placebo group; 56.0% were Hispanic or Latino, 14.9% were Black, 12.7% were American Indian or Alaska Native, 12.7% were non-Hispanic White, and 3.7% were of other or unknown race or ethnic group. The cumulative percentage of patients who had received mechanical ventilation or who had died by day 28 was 12.0% (95% confidence interval [CI], 8.5 to 16.9) in the tocilizumab group and 19.3% (95% CI, 13.3 to 27.4) in the placebo group (hazard ratio for mechanical ventilation or death, 0.56; 95% CI, 0.33 to 0.97; $P=0.04$ by the log-rank test). Clinical failure as assessed in a time-to-event analysis favored tocilizumab over placebo (hazard ratio, 0.55; 95% CI, 0.33 to 0.93). Death from any cause by day 28 occurred in 10.4% of the patients in the tocilizumab group and 8.6% of those in the placebo group (weighted difference, 2.0 percentage points; 95% CI, -5.2 to 7.8). In the safety population, serious adverse events occurred in 38 of 250 patients (15.2%) in the tocilizumab group and 25 of 127 patients (19.7%) in the placebo group.

CONCLUSIONS

In hospitalized patients with Covid-19 pneumonia who were not receiving mechanical ventilation, tocilizumab reduced the likelihood of progression to the composite outcome of mechanical ventilation or death, but it did not improve survival. No new safety signals were identified. (Funded by Genentech; EMPACTA ClinicalTrials.gov number, NCT04372186.)

Waiting for RECOVERY data on tocilizumab...

REMAP-CAP pre-print data

Adult within 24 hours of commencing organ support in ICU randomized to tocilizumab (8mg/kg) or sarilumab (400mg) or SOC.

- Median organ support-free days were 10 (-1, 16), 11 (IQR 0, 16) and 0 (IQR -1, 15) for tocilizumab, sarilumab and control, respectively.
- Relative to control, median adjusted odds ratios were 1.64 (1.25, 2.14) for tocilizumab and 1.76 (1.17, 2.91) for sarilumab, yielding >99.9% and 99.5% posterior probabilities of superiority compared with control.
- Hospital mortality was 28.0% (98/350) for tocilizumab, 22.2% (10/45) for sarilumab and 35.8% (142/397) for control.

- cryopyrin-associated periodic syndrome

Interleukin-1 blockade with high-dose anakinra in patients with COVID-19, acute respiratory distress syndrome, and hyperinflammation: a retrospective cohort study

Giulio Cavalli, Giacomo De Luca, Corrado Campochiaro, Emanuel Della-Torre, Marco Ripa, Diana Canetti, Chiara Oltolini, Barbara Castiglioni, Chiara Tassan Din, Nicola Boffini, Alessandro Tomelleri, Nicola Farina, Annalisa Ruggeri, Patrizia Rovere-Querini, Giuseppe Di Lucca, Sabina Martinenghi, Raffaella Scotti, Moreno Tresoldi, Fabio Ciceri, Giovanni Landoni, Alberto Zangrillo, Paolo Scarpellini, Lorenzo Dagna

- Retrospective, 29 vs. 16 pts
- Moderate-to-severe ARDS, and **hyperinflammation** (defined as serum C-reactive protein ≥ 100 mg/L, ferritin ≥ 900 ng/mL, or both) who were managed with non-invasive ventilation outside of the ICU
- Standard treatment vs. additional treatment with anakinra
 - 5 mg/kg x 2 intravenously [high dose]
 - or 100 x 2 subcutaneously [low dose] protracted until sustained benefit

JAK1/2 (JAK1/JAK2) inhibitors

- **Baricitinib**

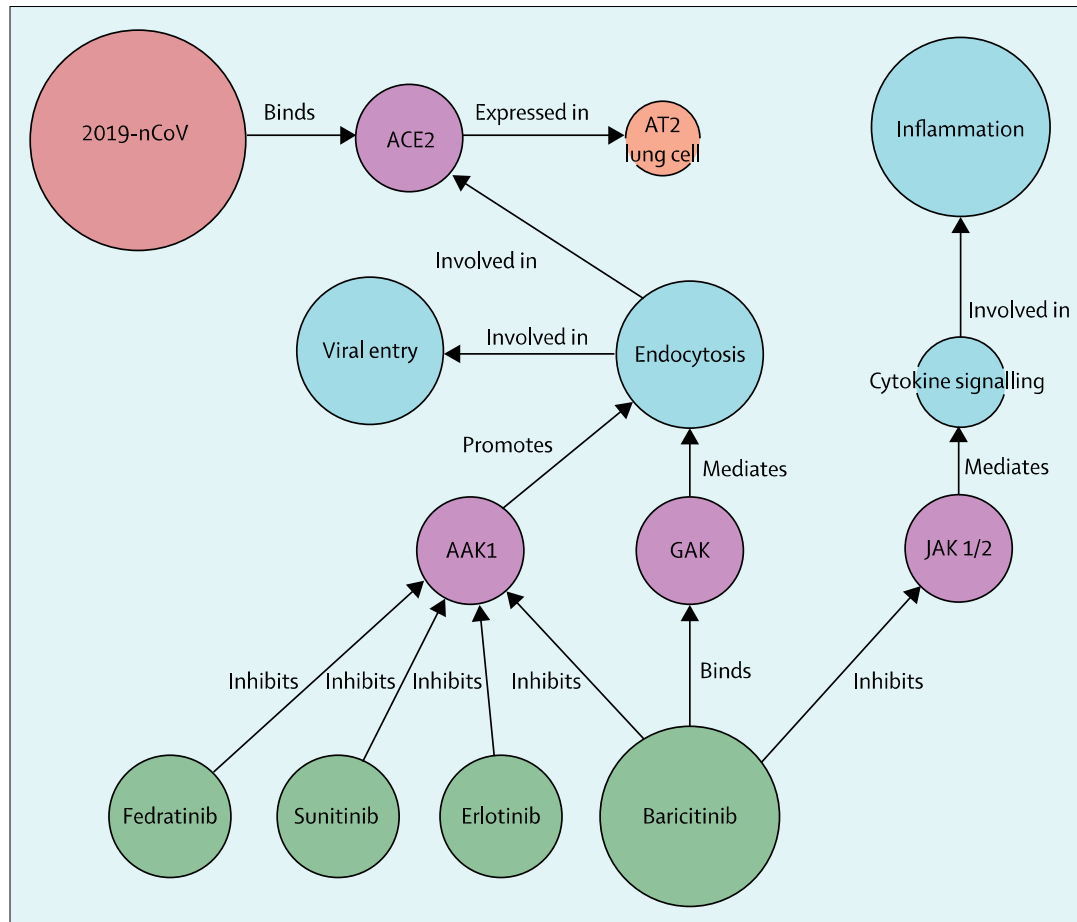

- JAK/JAK2 inhibitor
- Rheumatoid arthritis

- **Ruxolitinib**

- JAK1/JAK2 inhibitor
- Myelofibrosis
- Polycythemia vera
- GVHD

Baricitinib: theoretically

Baricitinib as potential treatment for 2019-nCoV acute respiratory disease

Baricitinib RCT

- Double-blind, randomized, placebo-controlled trial
- Baricitinib (4 mg, ≤ 14 days) plus remdesivir (≤ 10 days) in hospitalized adults
- 515 vs. 518 to control
 - Time to recovery 7 vs. 8 days ($P=0.03$)
 - 30% higher odds of improvement in clinical status at day 15
 - Patients receiving high-flow oxygen or NIV at enrollment had a time to recovery of 10 vs. 18 days
 - 28-day mortality was 5.1% vs. 7.8%
 - SAEs 16.0% vs. 21.0% ($P=0.03$)
 - New infections 5.9% vs. 11.2% ($P=0.003$).

Complement C3 vs C5 inhibition in severe COVID-19: Early clinical findings reveal differential biological efficacy

Other treatments

Eculizumab

Inhibits cleavage of C5 into C5a (proinflammatory) and C5b (C5b-9 pro-thrombotic)

*Case reports/case series
Ravulizumab study ongoing*

Emapalumab

MoAb anti IFN-gamma

Ongoing study prematurely stopped

Ruxolitinib

JAK/JAK2 inhibitor

*Several positive case series
No effect in a small RCT (Cao et al.), no effect in RUXCOVID trial (18.12.2020 press release)*

IVIg

*Case reports/case series
Positive results of a small RCT
(Gharebaghi et al., 30 vs. 29, mortality 20% vs. 48.3%, $p=0.025$)*

Thalidomide

Immunomodulatory, anti-inflammatory, antiangiogenic properties (TNF-alpha)

Case reports/case series

Imatinib

Tyrosin kinase inhibitor

*Case reports
RCT ongoing*

Vitamin D

- Several observations of lower levels in patients with COVID-19 and even lower with severe forms
- Immune-modulatory properties
- Supported by a network-based analysis (*Ahmed F, Front Immun*)
- Involved in bradykinin storm cascade
- One small interventional study reported better outcomes in treated patients

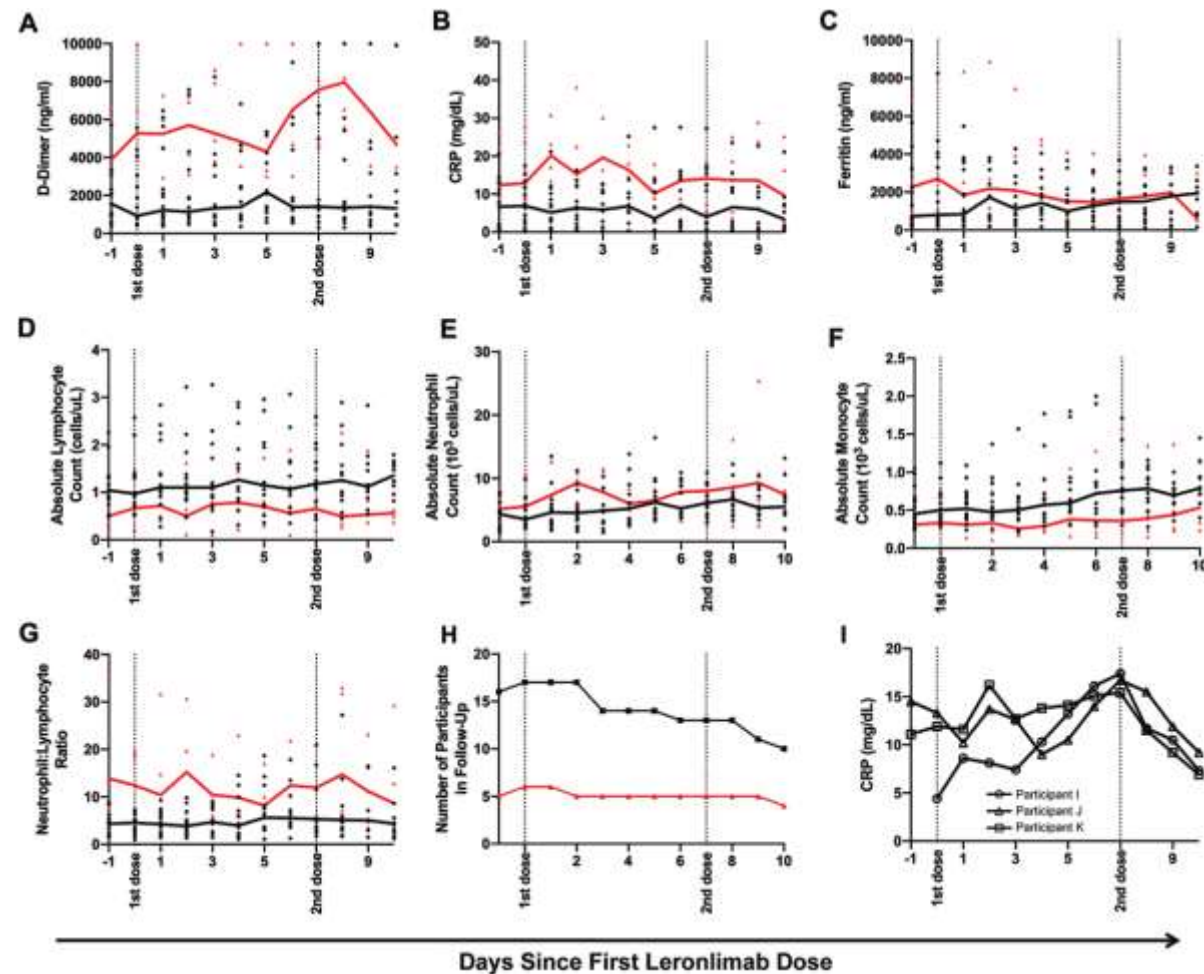

“Effect of calcifediol treatment and best available therapy versus best available therapy on intensive care unit admission and mortality among patients hospitalized for COVID-19: A pilot randomized clinical study”

Issues to consider when evaluating potential therapeutics for COVID-19

1. Targets in SARS-CoV-2 life cycle
2. Stage and severity of disease
3. Measured endpoint
 1. Mortality
 2. Clinical improvement
 3. Time to negative NP PCR

Additional issues to consider when evaluating potential therapeutics for COVID-19 beyond timing, dose/route, mechanism, DDIs, tolerability, measured outcomes, patients' immunity...

Systemic vs. Lung targeting vs. Central Nervous System

CNS involvement in COVID-19

- Neurological symptoms very common in patients with critical disease (>40%)
- CSF SARS-CoV-2 found in a minority of patients (1/4 in encephalitis)
- Several clinical pictures reported including:
 - **Encephalopathy**
 - **Guillain-Barré**
 - **Acute cerebrovascular disease (stroke in 2–6% of hospitalized patients)**
 - **CNS vasculitis**

FIG 5. Patchy/punctate postcontrast enhancement pattern with consistent small vessel involvement. Postcontrast T1 MR imaging shows intense patchy enhancement of all lesions, in particular the globus pallidus bilaterally (A, *white arrows*), with a punctuate pattern in the middle cerebellar peduncles and cerebellar hemispheres (B, *arrow*).

Immune effector Cell-associated Neurotoxicity Syndrome (ICANS)

Treatment of ICANS

GRADE 2 → dexamethasone 10 mg x 4 (3 dd)

GRADE 3 → dexamethasone 20 mg x 2 (3 dd)

GRADE 4 → methylprednisolone 1 g (3dd), then 250/125/60 (2 dd each)

If not successful consider high-dose cyclophosphamide, anakinra or siltuximab

Conclusions

- Immune modulation is a key treatment in patients with severe COVID-19
- Appropriate treatment dose, duration and timing is still under study
- Corticosteroids are the only drugs so far that were associated with improved survival
- IL-6/IL-6R compounds have positive results in observational studies but unclear benefit in randomized controlled trials
- Baricitinib data seem promising but need confirmatory studies with different comparator drugs
- Other treatments need to be verified in robust RCTs
- CNS involvement may benefit for higher corticosteroid doses (direct IL-6 blockade)
