

TAMING THE IMMUNE SYSTEM IN COVID-19

Andrea Calcagno
University of Turin

POTENTIAL CONFLICT OF INTEREST

I have read and understood ICMJE policy on declaration of interest and
I declare that in the past five years

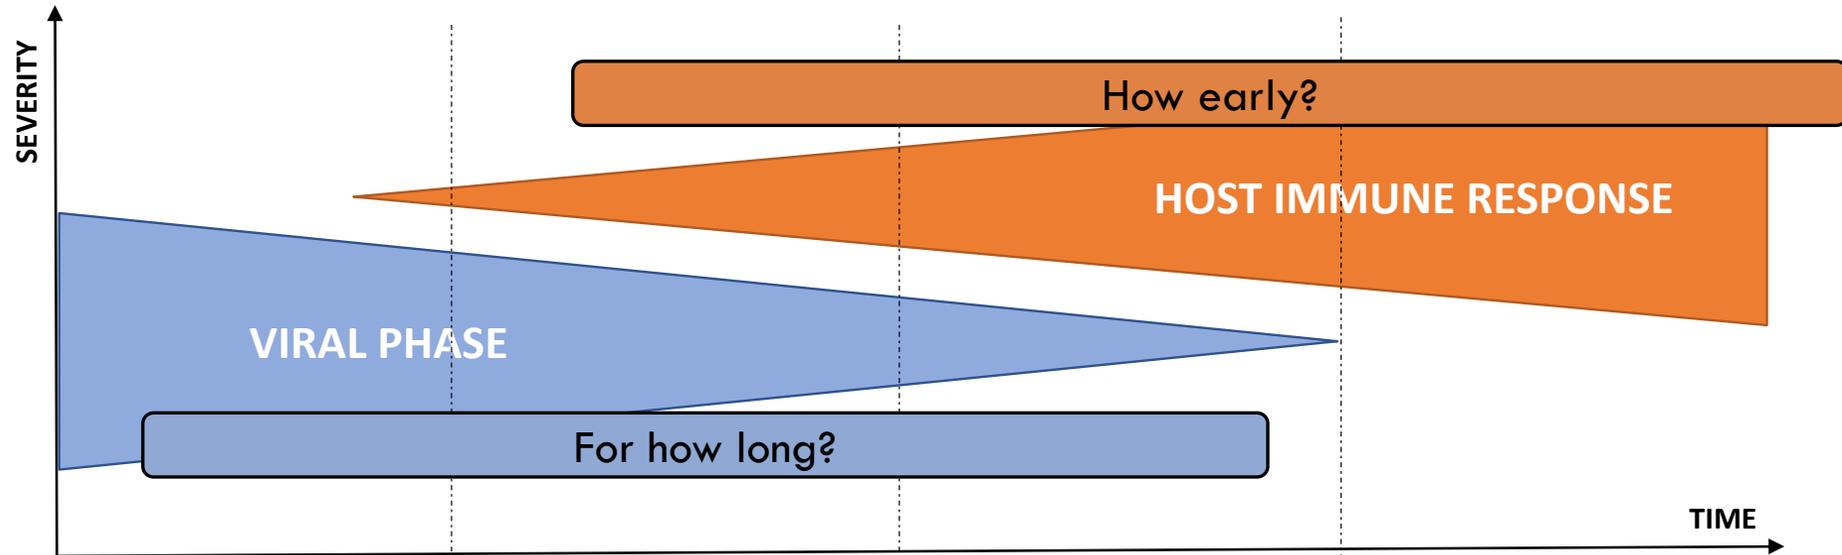

- My Institution has received research grants from Abbvie, Gilead, BMS, Janssen-Cilag and ViiV;
- I received speaker's and consultancy honoraria from Gilead, Insmad, Janssen-Cilag, MSD and ViiV.

**TRUE SCIENCE
TEACHES, ABOVE
ALL, TO DOUBT AND
TO BE IGNORANT.**

Miguel de Unamuno

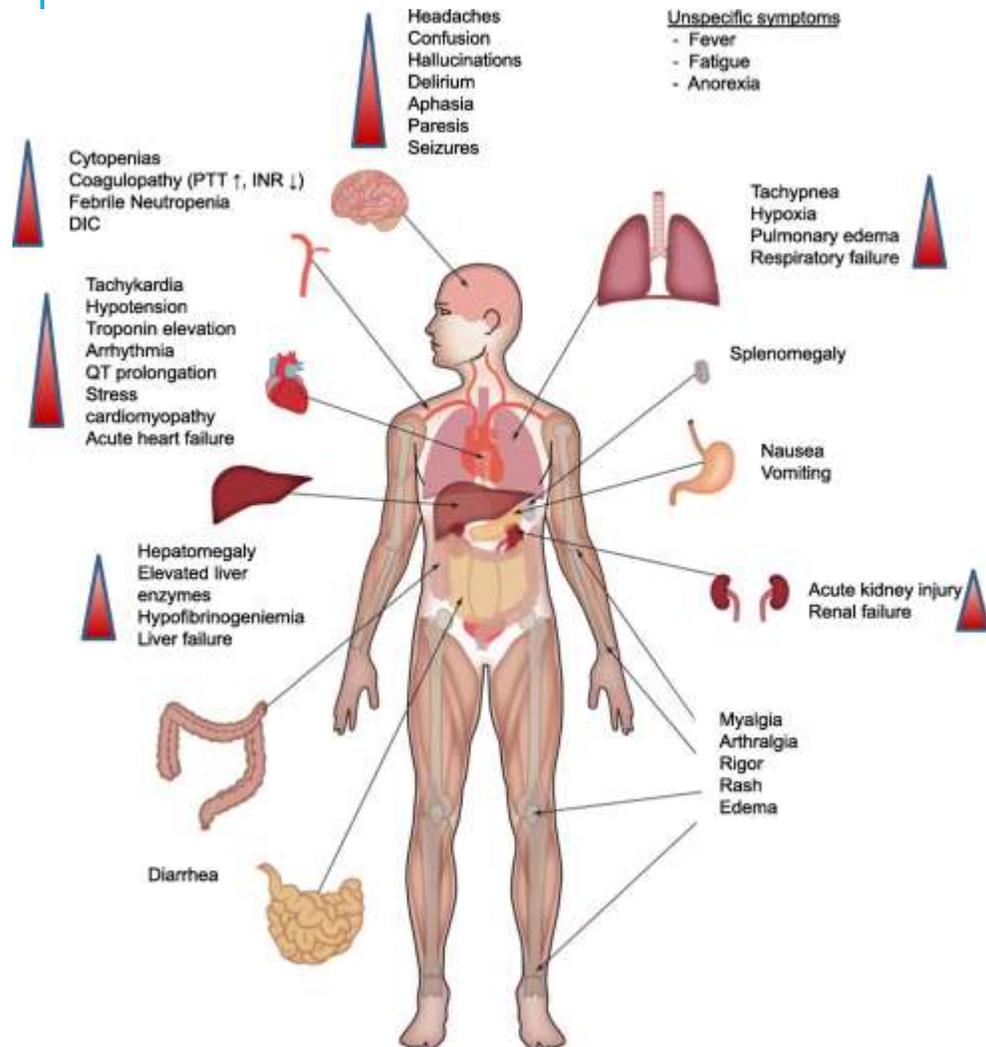

COVID-19 - PATHOGENESIS

Biomarker
Tresholds??

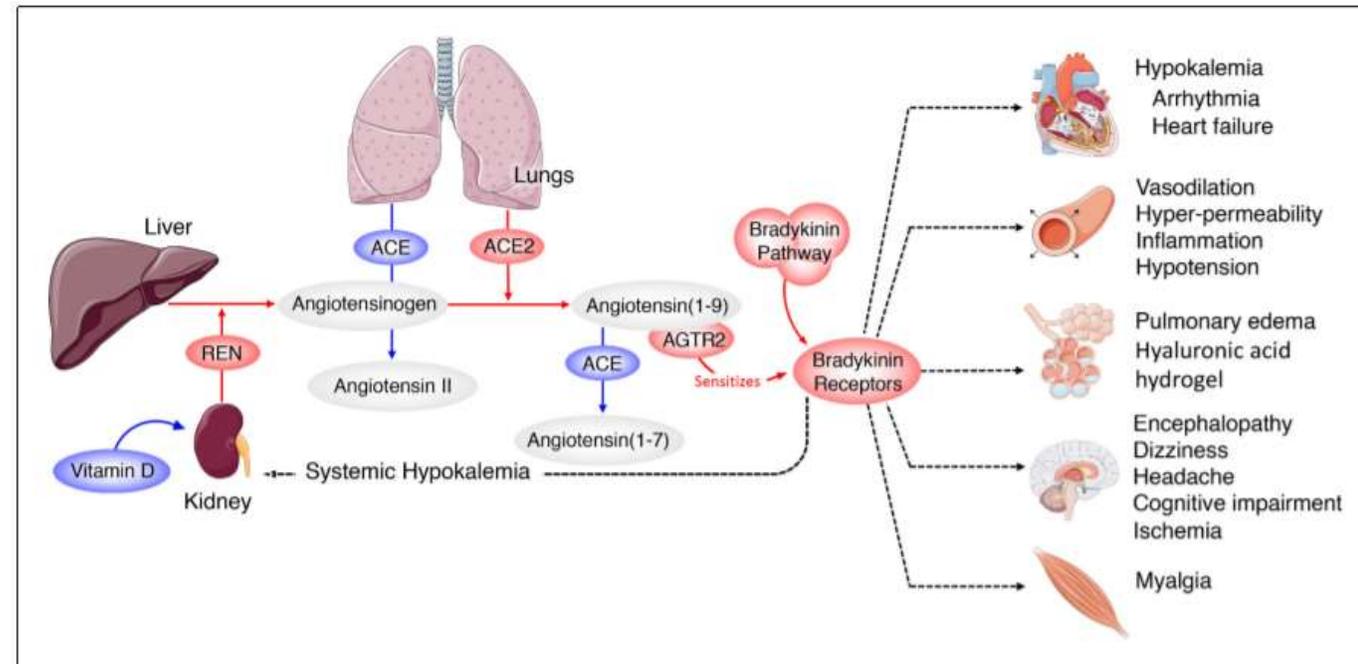

SIGNS & SYMPTOMS	Asymptomatic, fever <37.5°C, diarrhea, headache, asthenia, anosmia and ageusia, conjunctivitis		Dry cough, fever >37,5°C, arthro-myalgia	Shortness of breathe, Hypoxia, arrythmia	ARDS, SIRS, Shock, MOF, cardiac failure, MAS /HLH (Enlarged liver/spleen/lymph nodes), skin rash, Easy bruising and/or abnormal bleeding, fever >38.5°C.
LAB	Normal routine lab tests, mild lymphopenia, normal blood gas		Increasing lymphopenia, mild increase of PT and/or ferritin and/or D-Dimer and/or LDH, mild hypoxia >92	progressive increase of d-dimer and ferritin, increase transaminases and triglycerides, abnormal blood gas (hypoxia <92-hypocapnia etc.), mild increase NT-proBNP and troponin, IL6, CRP, reduction of platelet count	Elevation of inflammatory markers and ferritin, progressive cytopenias, increase in NT-proBNT, troponin and renal function markers
LUNG US	Normal	Localized B-lines	Diffuse B-lines – pleural line thickening	Diffuse B-lines – pleural line thickening – Subpleural consolidation, localized pleural effusion	Diffuse B-lines – pleural line thickening – Subpleural and alveolar consolidation – air bronchograms
CT SCAN	Normal	Localized supleural ground glass	Ground glass		Crazy paving

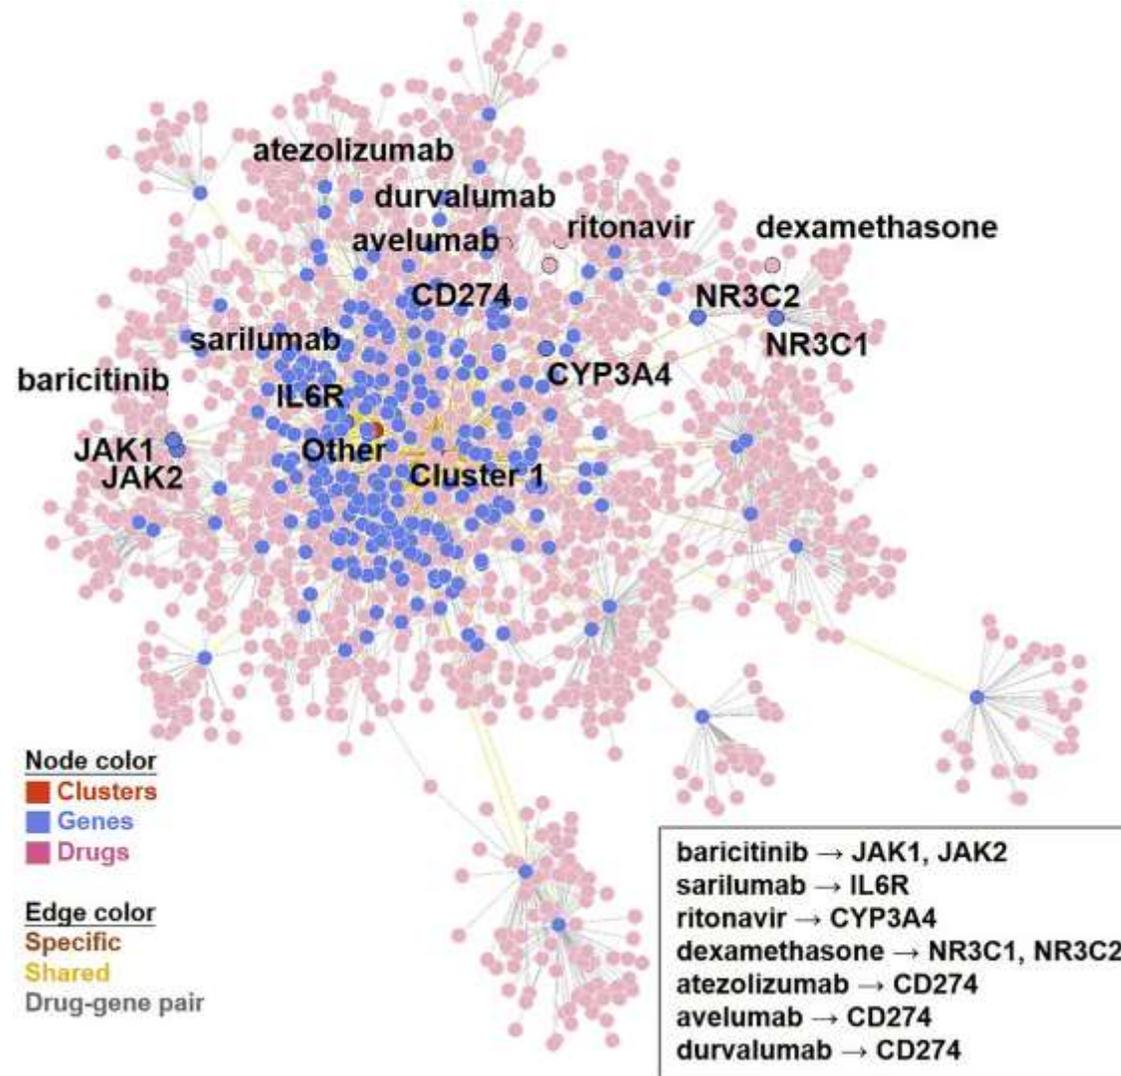

Cytokine Release Syndrome

Bradykinin Storm Syndrome

TRANSCRIPTOME NETWORK ANALYSIS

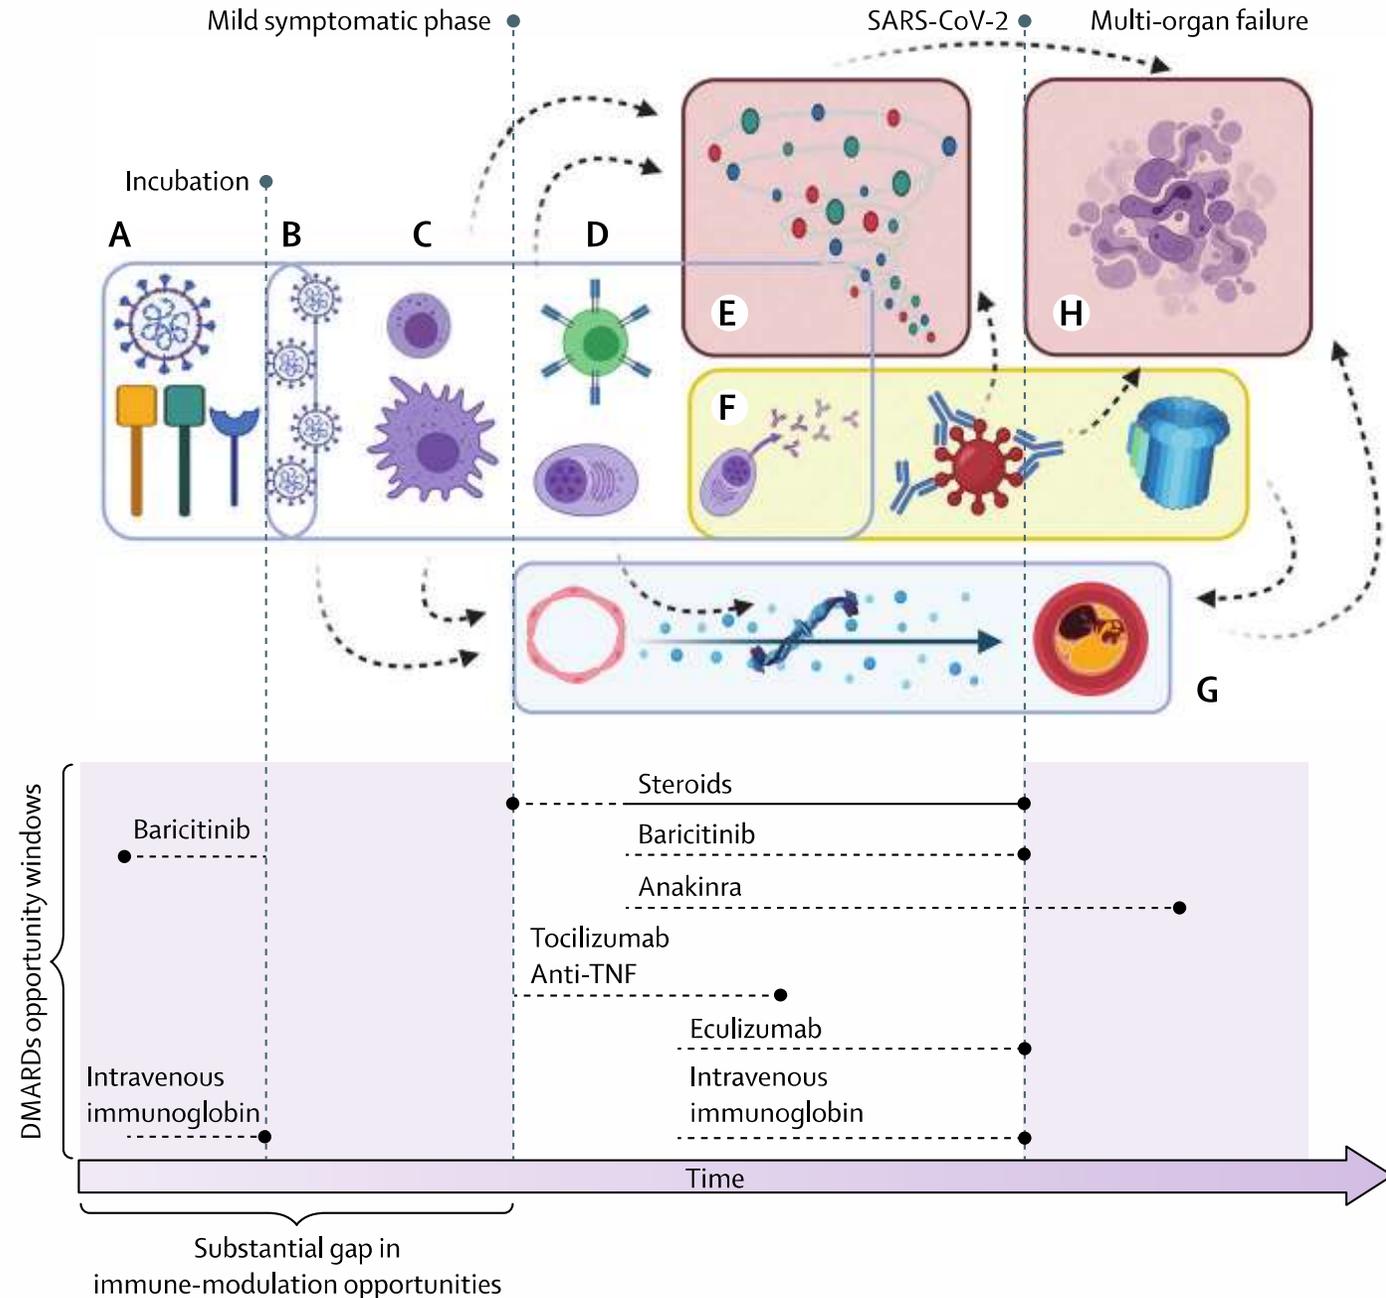

THE ROLE OF ANTIRHEUMATICS IN PATIENTS WITH COVID-19

NISSEN CB, ET AL. LANCET RHEUMATOL 2021

	Caricchio R et al (2020) ¹³	Webb BJ et al (2020) ¹⁴
Signs or symptoms of COVID-19	Presence of any COVID-19 signs or symptoms	Fever >38.0°C
Diagnostic test for COVID-19	RT-PCR positive for COVID-19	..
HRCT or chest x-ray	+Ground Glass Opacities by HRCT or chest X-ray	..
Ferritin	>250 µg/L	≥700 µg/L
C-reactive protein	>4.6 mg/dL	≥15 mg/dL (or IL-6 ≥15 pg/mL or triglyceride ≥150 mg/dL)
Albumin	<2.8 g/dL	..
Lymphocytes (%)	<10.2	Neutrophil to lymphocyte ratio ≥10 cells (or both haemoglobin ≤9.2 g/dL and platelet count <11 400 cells per µL.)
Neutrophils (absolute)	≤110 000 cells per µL	..
Alanine aminotransferase	>60 U/L	..
Aspartate aminotransferase	>87 U/L	..
D-dimers	>4930 ng/mL	≥1500 ng/mL
Lactate dehydrogenase	>416 U/L	≥400 U/L (or AST ≥100 U/L)
Troponin I	>1.09 ng/mL	..
Anion gap	<6.8 mmol/L	..
Chloride	>106 mmol/L	..
Potassium	>4.9 mmol/L	..
BUN to creatinine ratio	>29	..

■ Entry criteria
 ■ Cluster 1
 ■ Cluster 2
 ■ Cluster 3

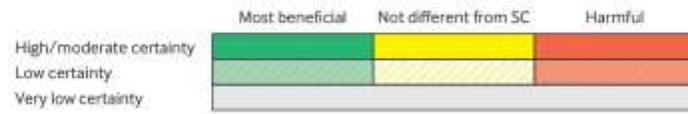

TREATMENT OF HOSPITALIZED PATIENTS IN

- **Early recognition of high-risk patients with pneumonia**
- **High flow nasal cannula and CPAP/NIV**
 - Pronation
 - Late intubation
- **Low molecular weight heparin**
 - Prophylactic in all patients (potential antiviral effect and prevention of thrombotic complications) 4000/6000 units of enoxaparin (according to weight)
 - Anticoagulant in critical/severe cases (enoxaparin 50→100 UI/Kg x2)?
- **Antivirals**
 - Remdesivir
 - Monoclonal antibodies
- **Antibiotics/Antifungals**
 - If proven/suspected co-infection
- **Anti-inflammatory agents**
 - Dexamethasone 6 mg for 5-10 days in those requiring oxygen
 - Tocilizumab
 - Anakinra?
 - Baricitinib?

CORTICOSTEROIDS

	Mortality	Mechanical ventilation	Adverse events	Admission to hospital	Viral clearance at 7 days†	Duration of hospital stay	ICU length of stay	Duration of mechanical ventilation	Time to symptom resolution	Time to viral clearance	Ventilator free days‡
Standard care*	130 per 1000	116 per 1000	9 per 1000	51 per 1000	500 per 1000	13 days	13 days	15 days	11 days	7 days	12 days

Umifenovir	794 (-130 to 870)										
Vitamin C	-50 (-89 to 22)	17 (-41 to 110)				-1.6 (-3.3 to 1.3)†					
Vitamin D	-11 (-86 to 150)	-63 (-96 to 7)				0 (-1.2 to 1.2)†					

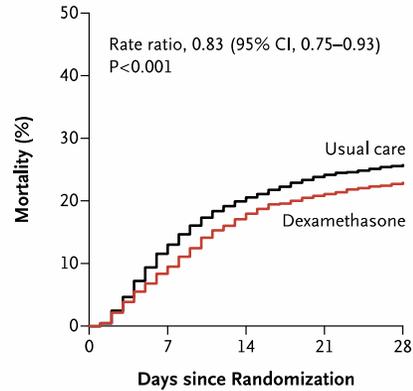

*The expected risk of each outcome with standard care is reported in the grey row. Numbers in the coloured cells are the estimated risk differences (95% CI) per 1000 patients or mean difference (95% CI) in days when compared to standard care
 † The best estimate of effect was obtained from direct evidence
 ‡ For this outcome, higher risk/mean is a benefit
 Empty cells: there was no evidence for the specific intervention
 IL-6i: Interleukin 6 inhibitors (tocilizumab, sarilumab); JAKi: Janus kinase inhibitors (baricitinib, ruxolitinib); rhG-CSF: Recombinant human granulocyte colony-stimulating factor

Dexamethasone in Hospitalized Patients with Covid-19 — Preliminary Report

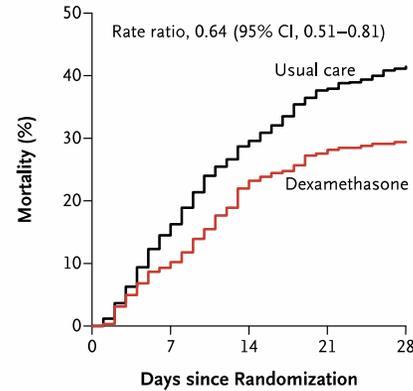

The RECOVERY Collaborative Group*

A All Participants (N=6425)

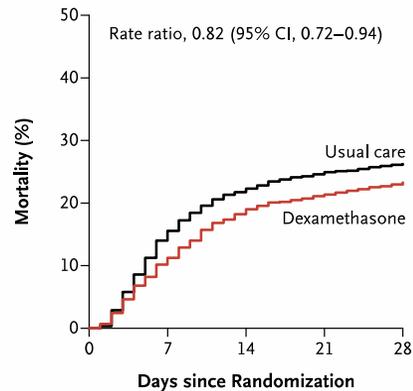

No. at Risk	0	7	14	21	28
Usual care	4321	3754	3427	3271	3205
Dexamethasone	2104	1903	1725	1659	1621

B Invasive Mechanical Ventilation (N=1007)

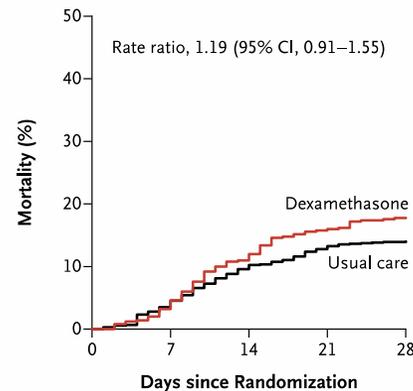

No. at Risk	0	7	14	21	28
Usual care	683	572	481	424	400
Dexamethasone	324	290	248	232	228

C Oxygen Only (N=3883)

No. at Risk	0	7	14	21	28
Usual care	2604	2195	2018	1950	1916
Dexamethasone	1279	1135	1036	1006	981

D No Oxygen Received (N=1535)

No. at Risk	0	7	14	21	28
Usual care	1034	987	928	897	889
Dexamethasone	501	478	441	421	412

- 2104 vs. 4321
- Oral or iv dexamethasone 6 mg/day up to 10 days (median 7 days, IQR 3-10)

Respiratory Support at Randomization

Respiratory Support at Randomization	Dexamethasone no. of events/total no. (%)	Usual Care no. of events/total no. (%)	Rate Ratio (95% CI)
Invasive mechanical ventilation	95/324 (29.3)	283/683 (41.4)	0.64 (0.51–0.81)
Oxygen only	298/1279 (23.3)	682/2604 (26.2)	0.82 (0.72–0.94)
No oxygen received	89/501 (17.8)	145/1034 (14.0)	1.19 (0.91–1.55)
All Patients	482/2104 (22.9)	1110/4321 (25.7)	0.83 (0.75–0.93)

Chi-square trend across three categories: 11.5

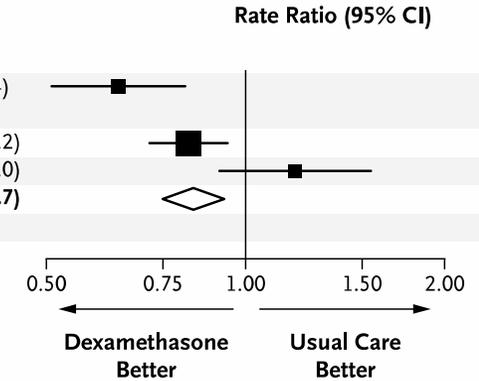

Table 2. Primary and Secondary Outcomes.

Outcome	Dexamethasone (N=2104)	Usual Care (N=4321)	Rate or Risk Ratio (95% CI)*
<i>no./total no. of patients (%)</i>			
Primary outcome			
Mortality at 28 days	482/2104 (22.9)	1110/4321 (25.7)	0.83 (0.75–0.93)
Secondary outcomes			
Discharged from hospital within 28 days	1413/2104 (67.2)	2745/4321 (63.5)	1.10 (1.03–1.17)
Invasive mechanical ventilation or death†	456/1780 (25.6)	994/3638 (27.3)	0.92 (0.84–1.01)
Invasive mechanical ventilation	102/1780 (5.7)	285/3638 (7.8)	0.77 (0.62–0.95)
Death	387/1780 (21.7)	827/3638 (22.7)	0.93 (0.84–1.03)

Association Between Administration of Systemic Corticosteroids and Mortality Among Critically Ill Patients With COVID-19

A Meta-analysis

The WHO Rapid Evidence Appraisal for COVID-19 Therapies (REACT) Working Group

Corticosteroids in Covid-19: One size does not fit all

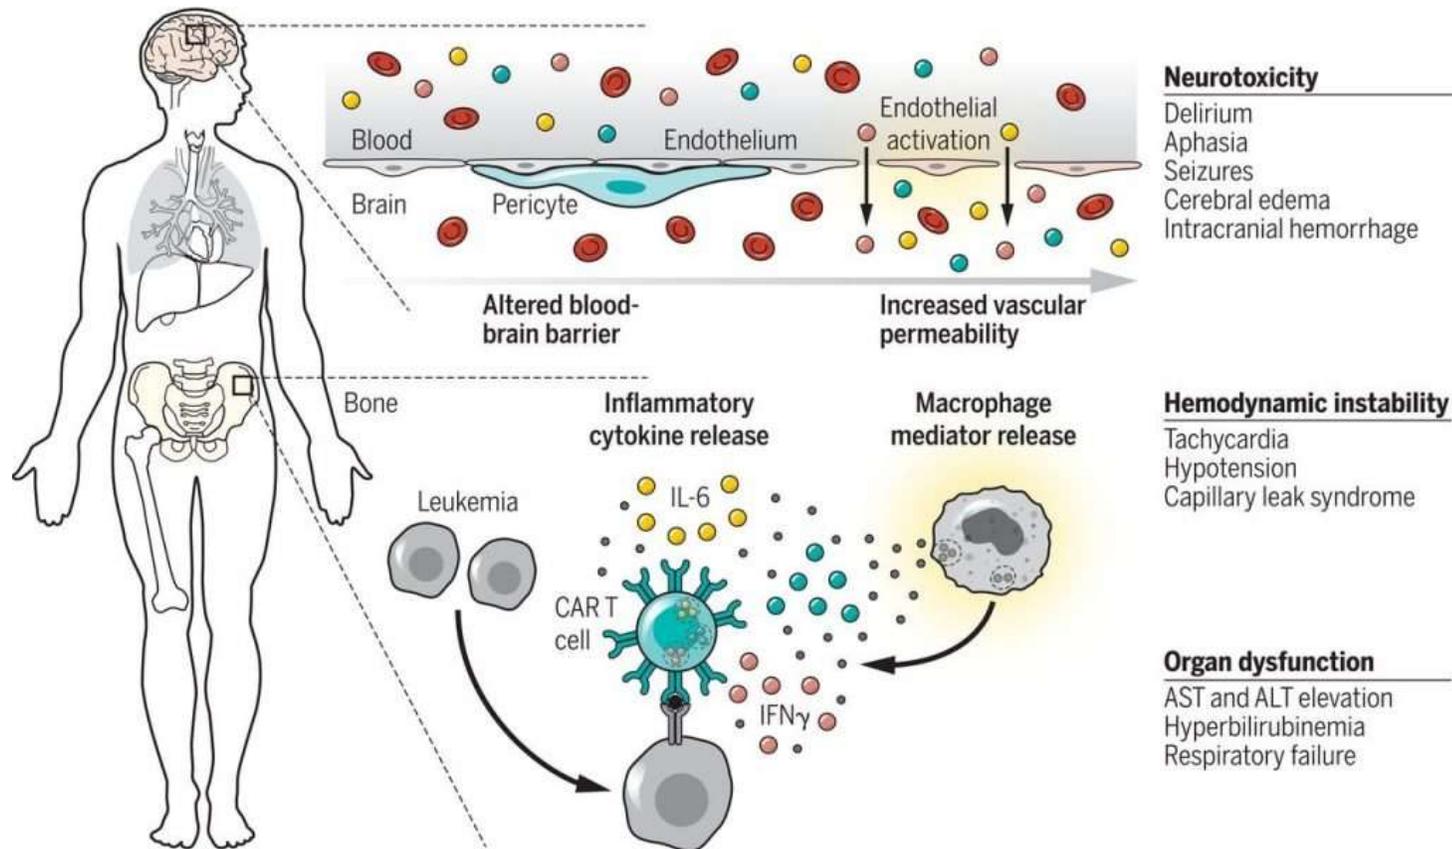

Athena Gogali, Chris Kyriakopoulos, Konstantinos Kostikas

Please cite this article as: Gogali A, Kyriakopoulos C, Kostikas K. Corticosteroids in Covid-19: One size does not fit all. *Eur Respir J* 2021; in press (https://doi.org/10.1183/13993003.00224-2021).

This manuscript has recently been accepted for publication in the *European Respiratory Journal*. It is published here in its accepted form prior to copyediting and typesetting by our production team. After these production processes are complete and the authors have approved the resulting proofs, the article will move to the latest issue of the ERJ online.

IMMUNE EFFECTOR CELL-ASSOCIATED NEUROTOXICITY SYNDROME (ICANS)

Treatment of ICANS

GRADE 2 → dexamethasone
10 mg x 4 (3 dd)

GRADE 3 → dexamethasone
20 mg x 2 (3 dd)

GRADE 4 →
methylprednisolone 1 g (3dd),
then 250/125/60 (2 dd each)

If not successful consider high-dose cyclophosphamide, anakinra or siltuximab

ANTI IL-6/IL-6R MEDICATIONS

1. Tocilizumab

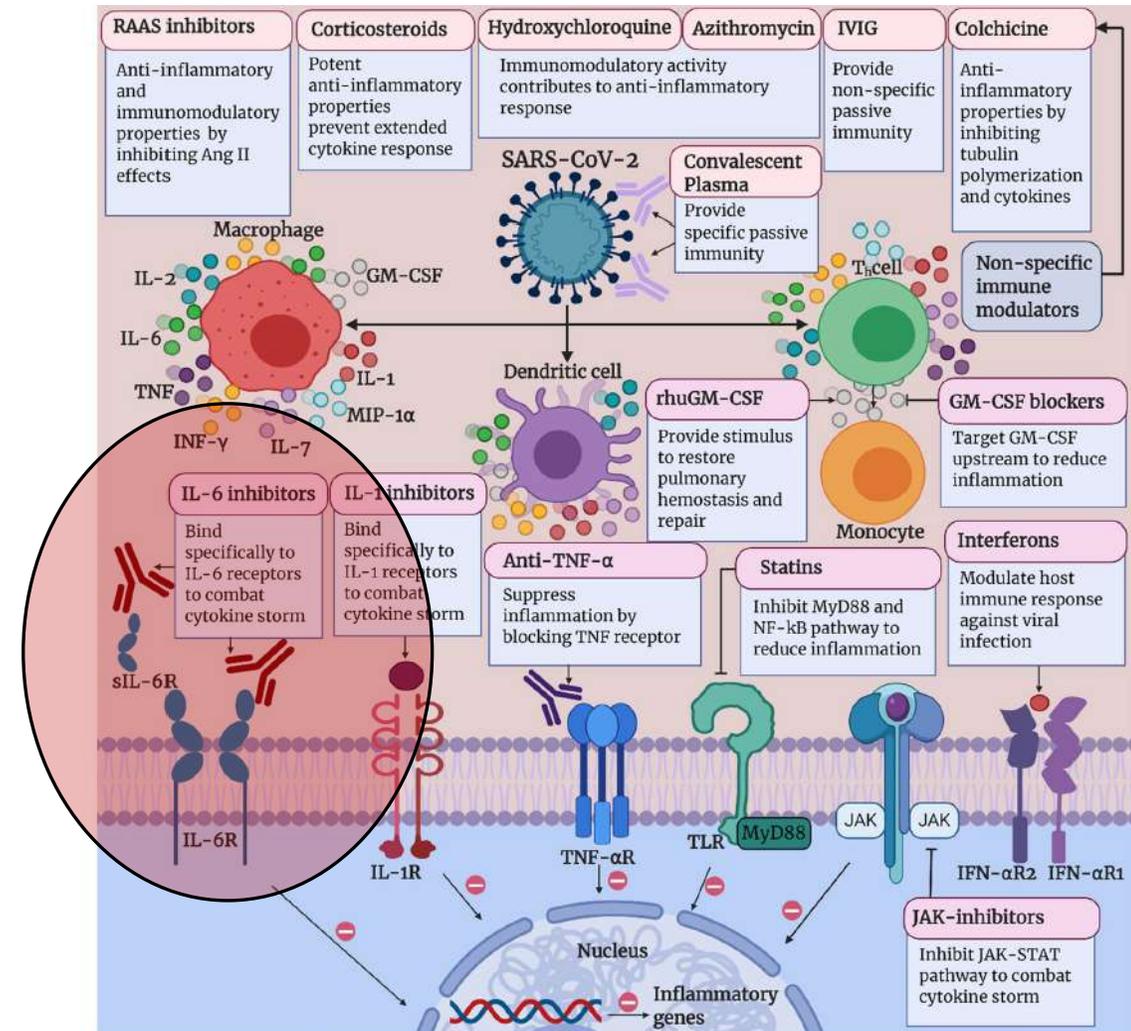

- Humanized MoAb against IL-6R
- Rheumatoid arthritis and systemic juvenile idiopathic arthritis

2. Sarilumab

- Human MoAb against IL-6R
- Rheumatoid arthritis

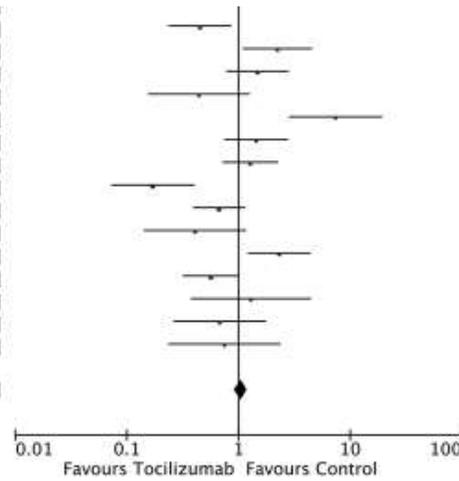

3. Siltuximab

- Chimeric MoAb that binds IL-6
- Multicentric Castleman's disease

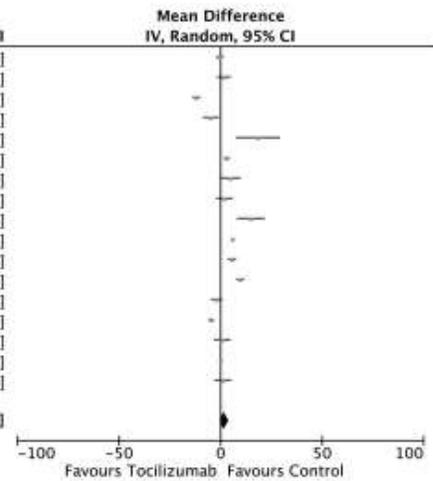

Figure 1. Association Between IL-6 Antagonists vs Usual Care or Placebo and Primary Outcome of 28-Day All-Cause Mortality

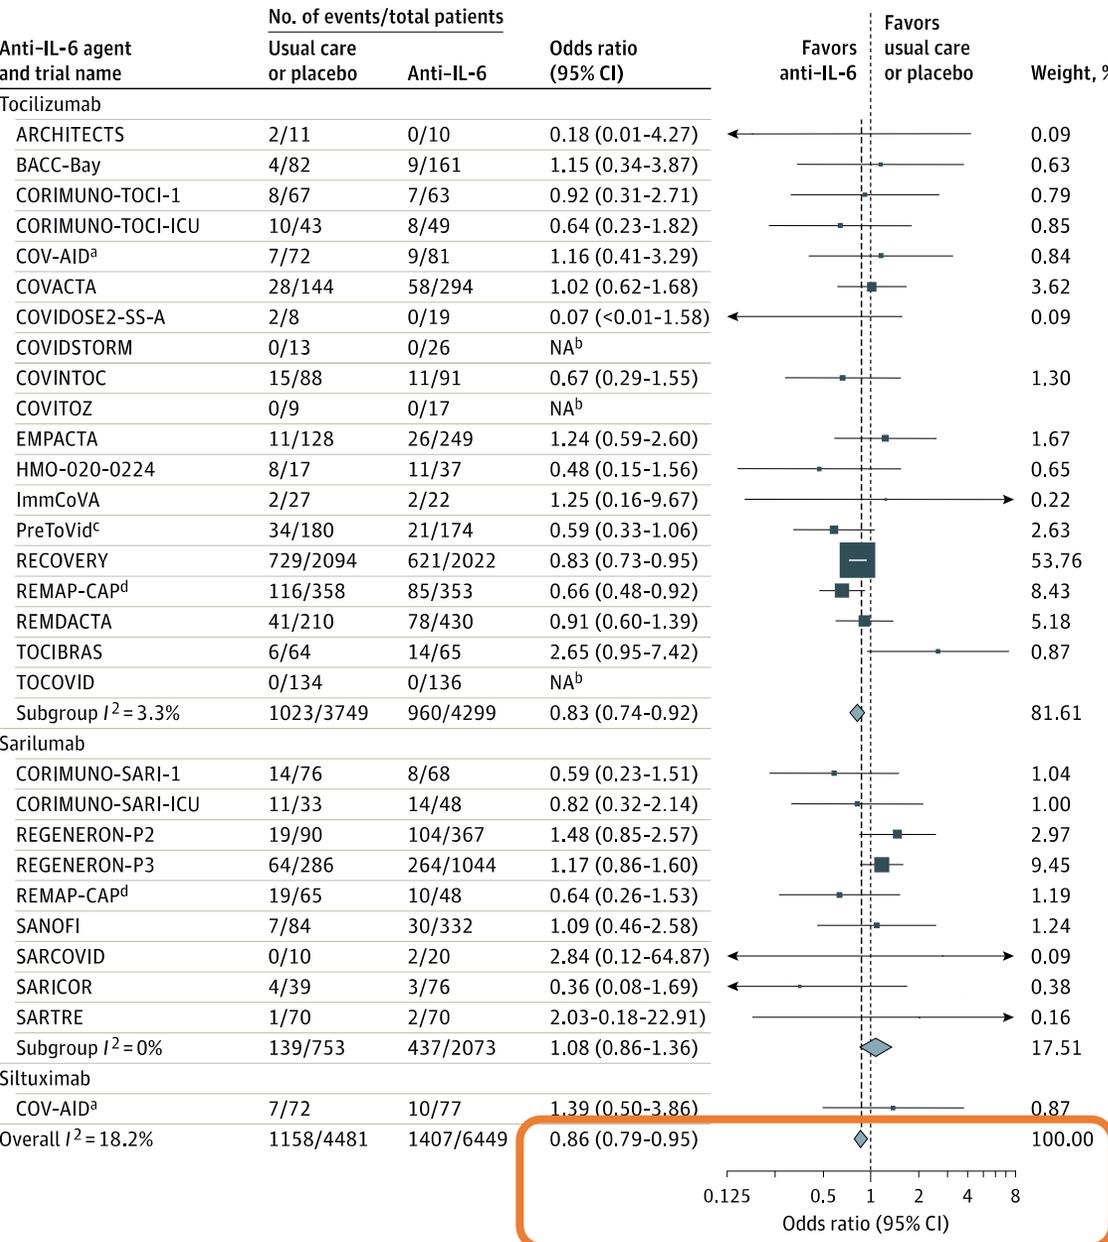

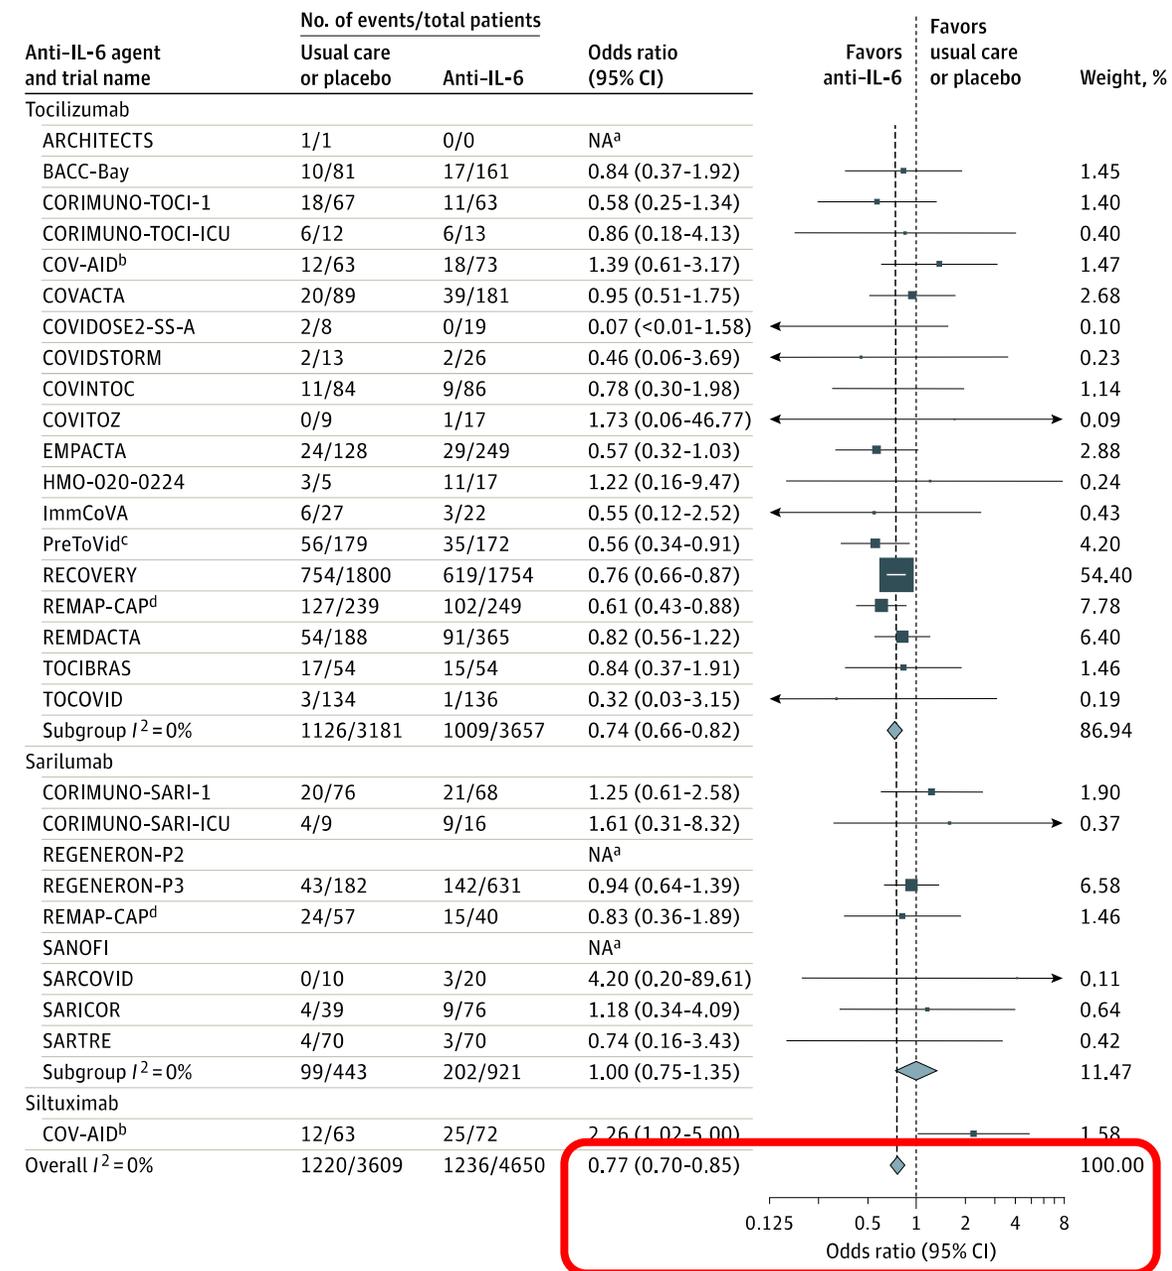

Figure 3. Association Between IL-6 Antagonists vs Usual Care or Placebo and Secondary Outcome of Progression to Invasive Mechanical Extracorporeal Membrane Oxygenation, or Death

ANTI IL-6/IL-6R: OPEN QUESTIONS

Timing?

Clinical/Lab test based

Early administration of interleukin-6 inhibitors for patients with severe COVID-19 disease is associated with decreased intubation, reduced mortality, and increased discharge

Sinha P, et al. Int J Infect Dis 2020

Dose (1 or 2?) and route of administration?

Pilot prospective open, single-arm multicentre study on off-label use of tocilizumab in patients with severe COVID-19

Sciascia S, Exp Rheumatol 2020

Tocilizumab in patients with severe COVID-19: a retrospective cohort study

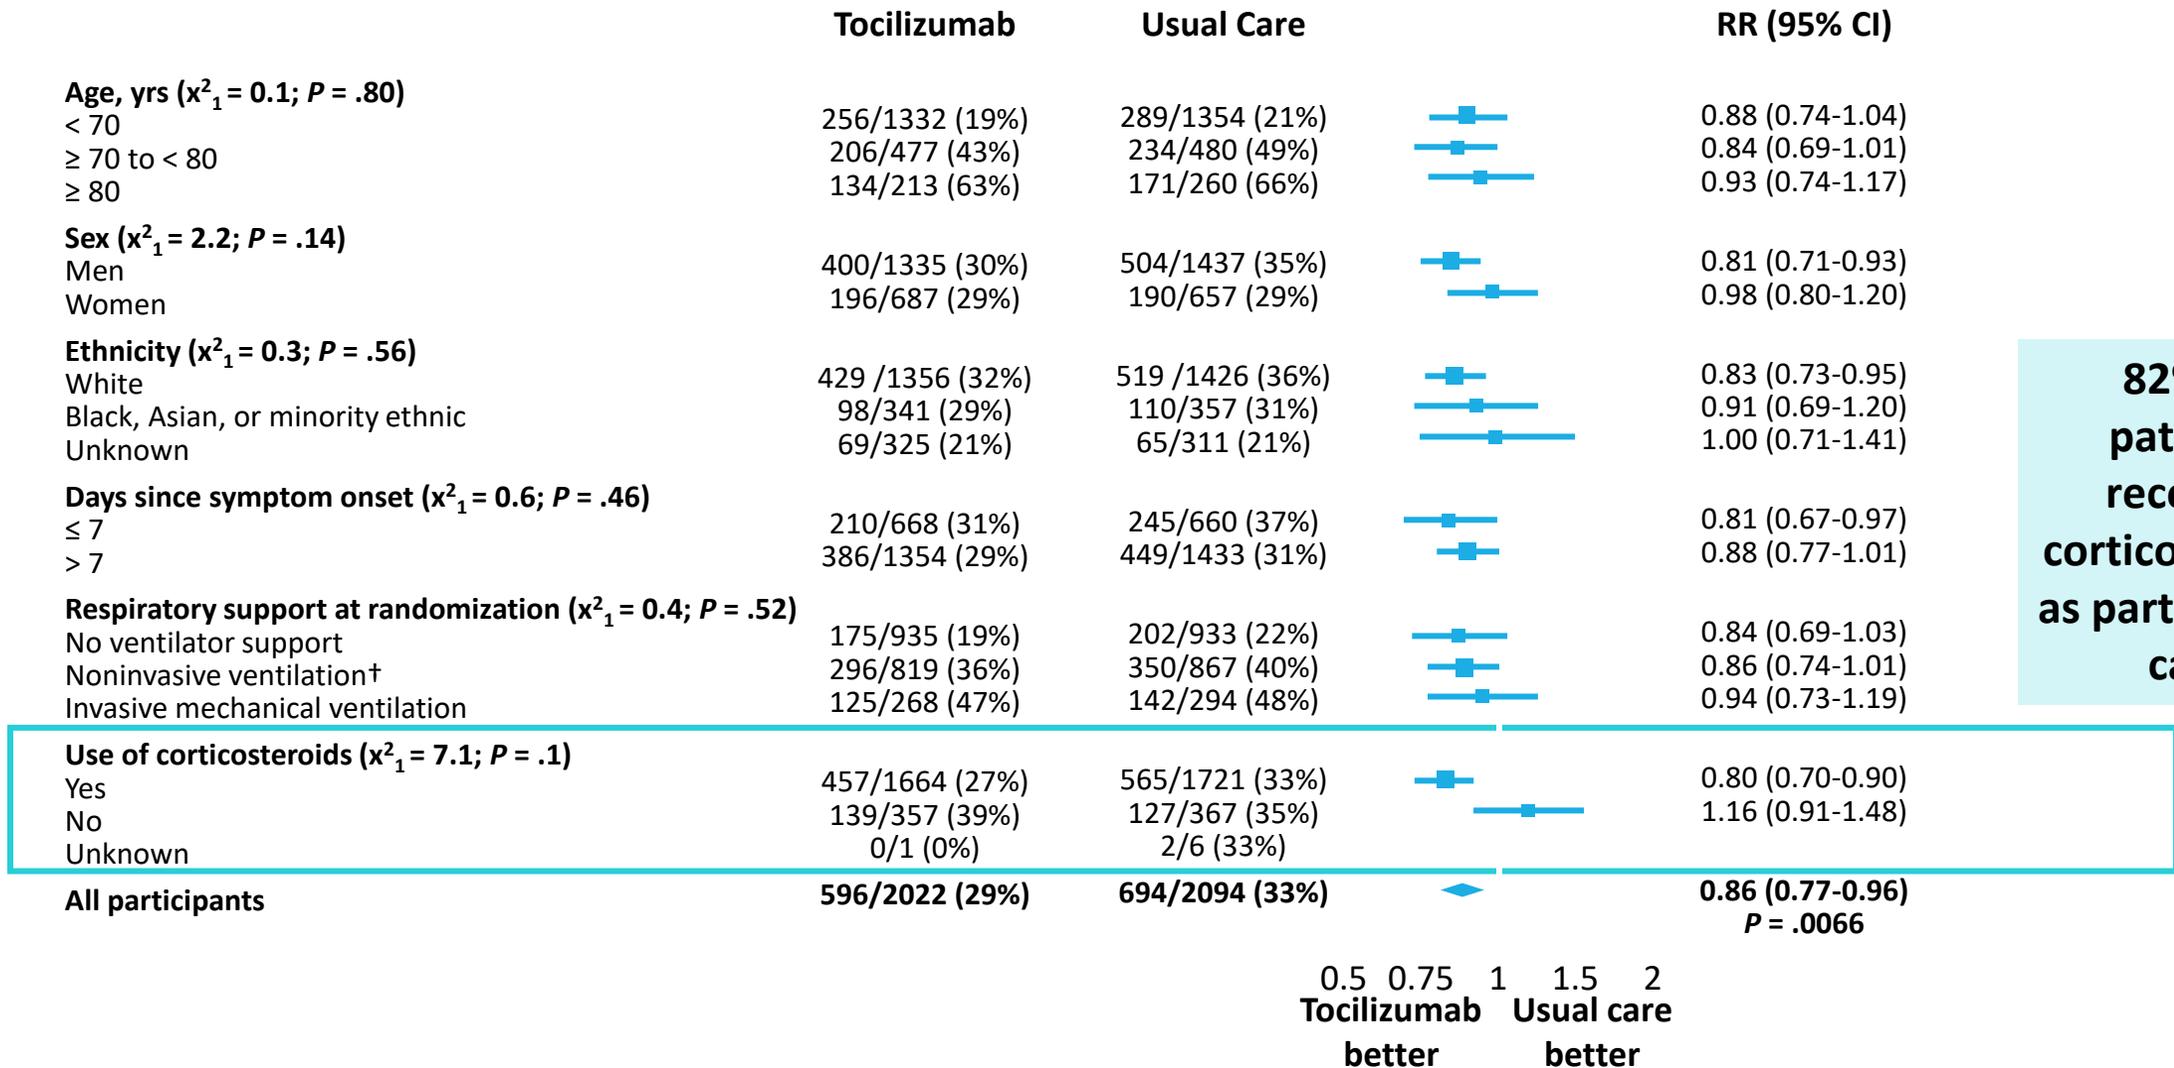

Guaraldi G, et al. Lancet Rheumatol 2020

Mono or combination therapy?

Comparative Survival Analysis of Immunomodulatory Therapy for Coronavirus Disease 2019 Cytokine Storm

Narain S, et al. Chest 2020

RECOVERY: 28-DAY MORTALITY BY BL CHARACTERISTICS

82% of patients received corticosteroids as part of usual care

0.5 0.75 1 1.5 2
Tocilizumab better **Usual care better**

Tocilizumab 8 mg/kg (max 800 mg) **i.v.** (one single administration, insufficient data to recommend two doses yet several countries use 2 doses) **in adult hospitalized patients** with

1. **Confirmed SARS-CoV-2 infection**
2. **Respiratory failure as $\text{SatO}_2 < 92\%$ (room air) or need for oxygen**

when?

In the first 24-72 h after the introduction of HFNC, NIV/CPAP or IV in addition to corticosteroids (REMAP-CAP criteria);

or

progressive oxygen supplementation required and $\text{CRP} \geq 7.5 \text{ mg/dL}$ (while on dexamethasone) (RECOVERY criteria)

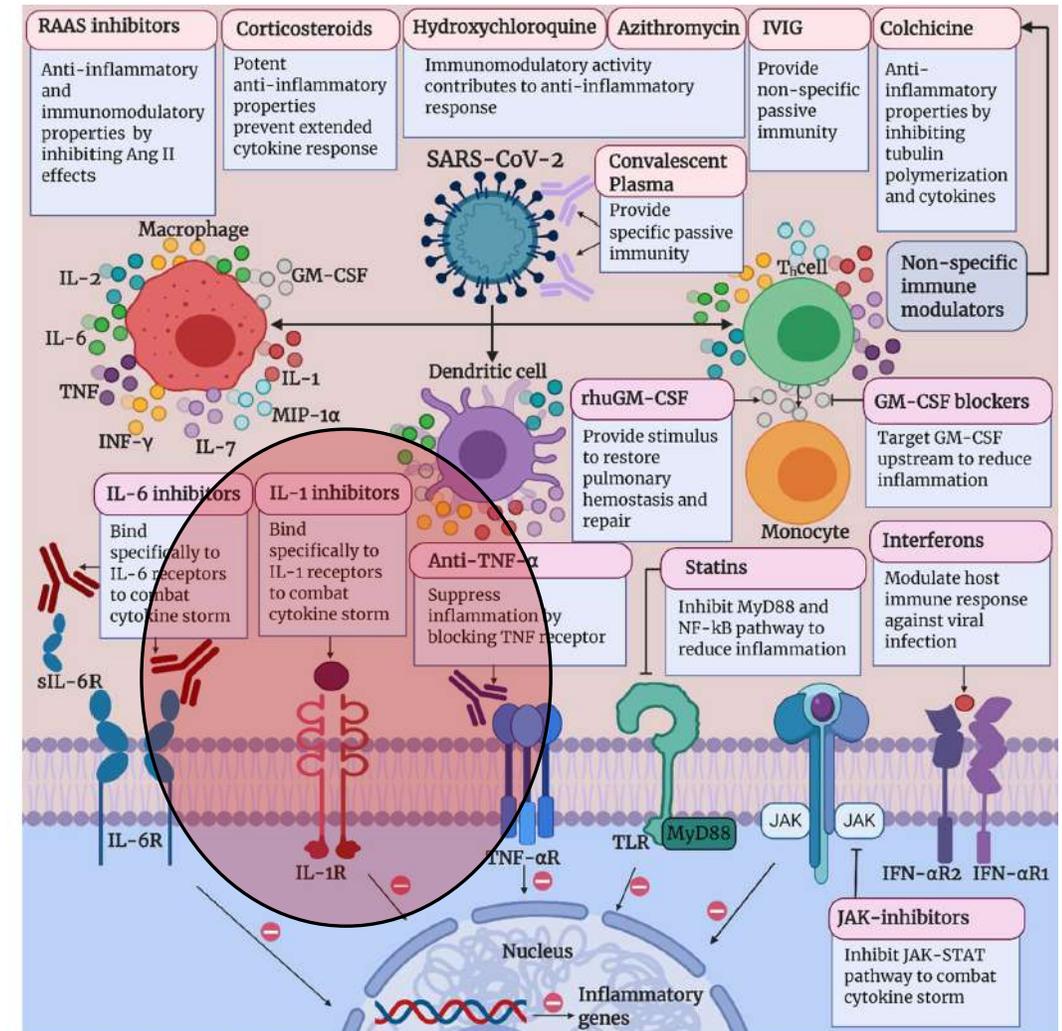

ANTI IL-1R MEDICATIONS

Anakinra

- Recombinant IL-1 R antagonist
- Rheumatoid arthritis
- cryopyrin-associated periodic syndrome
- Macrophage activation syndrome
- Hemophagocytic lymphohistiocytosis

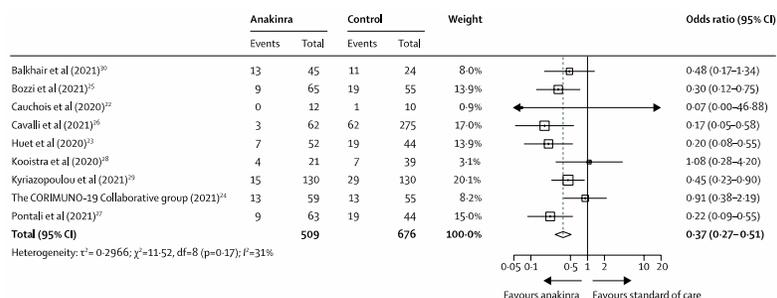

Canakinumab

- Human anti IL-1 Beta
- systemic juvenile idiopathic arthritis
- Still's disease
- cryopyrin-associated periodic syndrome

ANAKINRA STUDIES

SAVE MORE

Anakinra 100 mg s.c. once daily for 7-10 days

- RCT, Italy and Greece
- Inclusion criteria:
 - Hospitalized with COVID-19 pneumonia
 - **plasma suPAR ≥ 6 ng ml⁻¹**
 - no stage IV malignancy
 - no do-not-resuscitate order
 - **p/f > 150 mmHg**
 - **no need of NIV (CPAP or BPAP) or MV**
 - no primary immunodeficiency
 - neutrophils > 1500 /mm³
 - no anti-cytokine biological treatment, including JAK inhibitors, during the last 1 month
 - no severe hepatic failure
 - no end-stage renal failure necessitating hemofiltration or peritoneal hemodialysis

Summary

Background Evidence suggests a role for excessive inflammation in COVID-19 complications. Colchicine is an oral anti-inflammatory medication beneficial in gout, pericarditis, and coronary disease. We aimed to investigate the effect of colchicine on the composite of COVID-19-related death or hospital admission.

Methods The present study is a phase 3, randomised, double-blind, adaptive, placebo-controlled, multicentre trial. The study was done in Brazil, Canada, Greece, South Africa, Spain, and the USA, and was led by the Montreal Heart Institute. Patients with COVID-19 diagnosed by PCR testing or clinical criteria who were not being treated in hospital were eligible if they were at least 40 years old and had at least one high-risk characteristic. The randomisation list was computer-generated by an unmasked biostatistician, and masked randomisation was centralised and done electronically through an automated interactive web-response system. The allocation sequence was unstratified and used a 1:1 ratio with a blocking schema and block sizes of six. Patients were randomly assigned to receive orally administered colchicine (0.5 mg twice per day for 3 days and then once per day for 27 days thereafter) or matching placebo. The primary efficacy endpoint was the composite of death or hospital admission for COVID-19. Vital status at the end of the study was available for 97.9% of patients. The analyses were done according to the intention-to-treat principle. The COLCORONA trial is registered with ClinicalTrials.gov (NCT04322682) and is now closed to new participants.

Findings Trial enrolment began in March 23, 2020, and was completed in Dec 22, 2020. A total of 4488 patients (53.9% women; median age 54.0 years, IQR 47.0–61.0) were enrolled and 2235 patients were randomly assigned to colchicine and 2253 to placebo. The primary endpoint occurred in 104 (4.7%) of 2235 patients in the colchicine group and 131 (5.8%) of 2253 patients in the placebo group (odds ratio [OR] 0.79, 95.1% CI 0.61–1.03; p=0.081). Among the 4159 patients with PCR-confirmed COVID-19, the primary endpoint occurred in 96 (4.6%) of 2075 patients in the colchicine group and 126 (6.0%) of 2084 patients in the placebo group (OR 0.75, 0.57–0.99; p=0.042). Serious adverse events were reported in 108 (4.9%) of 2195 patients in the colchicine group and 139 (6.3%) of 2217 patients in the placebo group (p=0.051); pneumonia occurred in 63 (2.9%) of 2195 patients in the colchicine group and 92 (4.1%) of 2217 patients in the placebo group (p=0.021). Diarrhoea was reported in 300 (13.7%) of 2195 patients in the colchicine group and 161 (7.3%) of 2217 patients in the placebo group (p<0.0001).

Interpretation In community-treated patients including those without a mandatory diagnostic test, the effect of colchicine on COVID-19-related clinical events was not statistically significant. Among patients with PCR-confirmed COVID-19, colchicine led to a lower rate of the composite of death or hospital admission than placebo. Given the absence of orally administered therapies to prevent COVID-19 complications in community-treated patients and the benefit of colchicine in patients with PCR-proven COVID-19, this safe and inexpensive anti-inflammatory agent could be considered for use in those at risk of complications. Notwithstanding these considerations, replication in other studies of PCR-positive community-treated patients is recommended.

Effect of a Single High Dose of Vitamin D₃ on Hospital Length of Stay in Patients With Moderate to Severe COVID-19: A Randomized Clinical Trial

Igor H. Murai, PhD; Alan L. Fernandes, PhD; Lucas P. Sales, MSc; Ana J. Pinto, BSc; Karla F. Goessler, PhD; Camila S. C. Duran, MD; Carla B. R. Silva, MD; André S. Franco, MD; Marina B. Pereira, MD, PhD

IMPORTANCE The efficacy of vitamin D₃ supplementation in coronavirus disease 2019 (COVID-19) remains unclear.

OBJECTIVE To investigate the effect of a single high dose of vitamin D₃ on hospital length of stay in patients with COVID-19.

DESIGN, SETTING, AND PARTICIPANTS This was a multicenter, double-blind, randomized, placebo-controlled trial conducted in 2 sites in Sao Paulo, Brazil. The study included 240 hospitalized patients with COVID-19 who were moderately to severely ill at the time of enrollment from June 2, 2020, to August 27, 2020. The final follow-up was on October 7, 2020.

INTERVENTIONS Patients were randomly assigned to receive a single oral dose of 200 000 IU of vitamin D₃ (n = 120) or placebo (n = 120).

MAIN OUTCOMES AND MEASURES The primary outcome was length of stay, defined as the time from the date of randomization to hospital discharge. Prespecified secondary outcomes included mortality during hospitalization; the number of patients admitted to the intensive care unit; the number of patients who required mechanical ventilation and the duration of mechanical ventilation; and serum levels of 25-hydroxyvitamin D, total calcium, creatinine, and C-reactive protein.

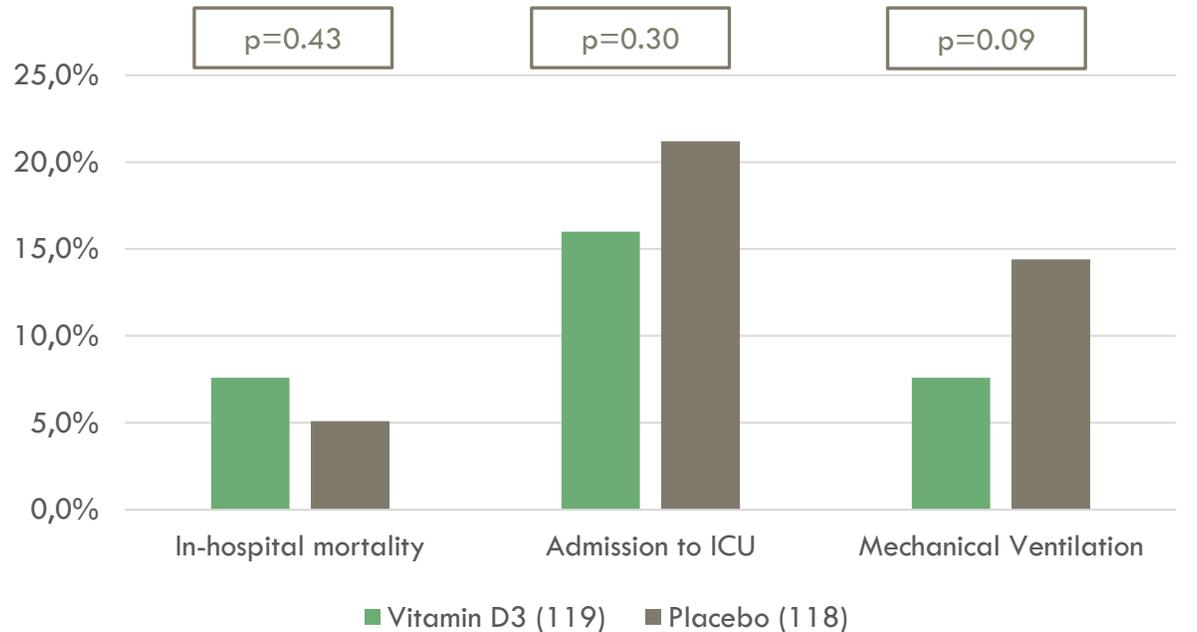

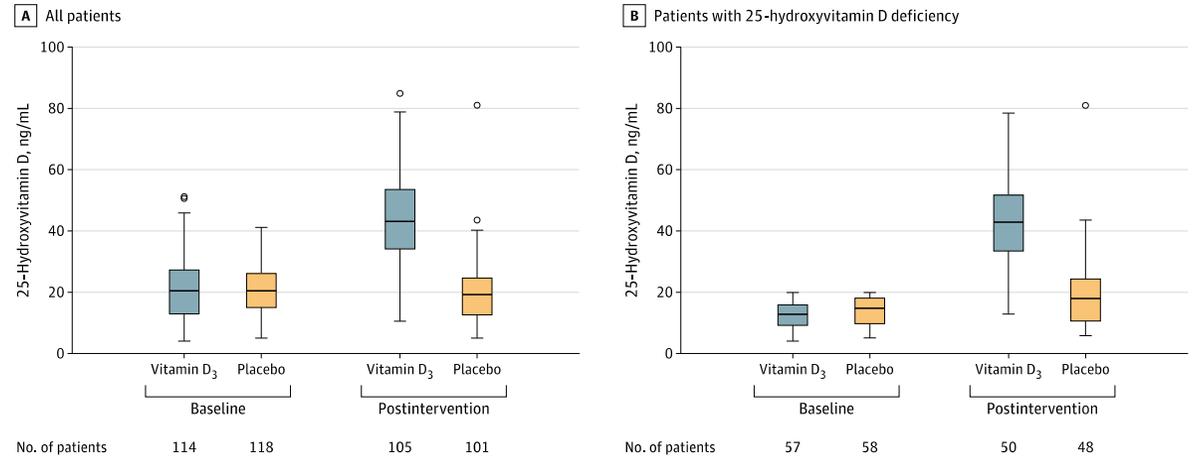

RESULTS Of 240 randomized patients, 237 were included in the primary analysis (mean [SD] age, 56.2 [14.4] years; 104 [43.9%] women; mean [SD] baseline 25-hydroxyvitamin D level, 20.9 [9.2] ng/mL). Median (interquartile range) length of stay was not significantly different between the vitamin D₃ (7.0 [4.0-10.0] days) and placebo groups (7.0 [5.0-13.0] days) (log-rank P = .59; unadjusted hazard ratio for hospital discharge, 1.07 [95% CI, 0.82-1.39]; P = .62). The difference between the vitamin D₃ group and the placebo group was not significant for in-hospital mortality (7.6% vs 5.1%; difference, 2.5% [95% CI, -4.1% to 9.2%]; P = .43), admission to the intensive care unit (16.0% vs 21.2%; difference, -5.2% [95% CI, -15.1% to 4.7%]; P = .30), or need for mechanical ventilation (7.6% vs 14.4%; difference, -6.8% [95% CI, -15.1% to 1.2%]; P = .09). Mean serum levels of 25-hydroxyvitamin D significantly increased after a single dose of vitamin D₃ vs placebo (44.4 ng/mL vs 19.8 ng/mL; difference, 24.1 ng/mL [95% CI, 19.5-28.7]; P < .001). There were no adverse events, but an episode of vomiting was associated with the intervention.

CONCLUSIONS AND RELEVANCE Among hospitalized patients with COVID-19, a single high dose of vitamin D₃, compared with placebo, did not significantly reduce hospital length of stay. The findings do not support the use of a high dose of vitamin D₃ for treatment of moderate to severe COVID-19.

OPEN

Impact of daily high dose oral vitamin D therapy on the inflammatory markers in patients with COVID 19 disease

Maheshwar Lakkireddy¹, Srikanth Goud Gadiga², R. D. Malathi², Madhu Latha Karra^{1✉}, I. S. S. V. Prasad Murthy Raju², Ragini², Sangeetha Chinapaka², K. S. S. Sai Baba¹ & Manohar Kandakatla¹

COVID 19 is known to cause immune dysregulation and vitamin D is a known immunomodulator. This study aims to objectively investigate the impact of Pulse D therapy in reducing the inflammatory markers of COVID-19. Consented COVID-19 patients with hypovitaminosis D were evaluated for inflammatory markers (N/L ratio, CRP, LDH, IL6, Ferritin) along with vitamin D on 0th day and 9th/11th day as per their respective BMI category. Subjects were randomised into VD and NVD groups. VD group received Pulse D therapy (targeted daily supplementation of 60,000 IUs of vitamin D for 8 or 10 days depending upon their BMI) in addition to the standard treatment. NVD group received standard treatment alone. Differences in the variables between the two groups were analysed for statistical significance. Eighty seven out of one hundred and thirty subjects have completed the study (VD:44, NVD:43). Vitamin D level has increased from 16 ± 6 ng/ml to 89 ± 32 ng/ml after Pulse D therapy in VD group and highly significant ($p < 0.01$) reduction of all the measured inflammatory markers was noted. Reduction of markers in NVD group was insignificant ($p > 0.05$). The difference in the reduction of markers between the groups (NVD vs VD) was highly significant ($p < 0.01$). Therapeutic improvement in vitamin D to 80–100 ng/ml has significantly reduced the inflammatory markers associated with COVID-19 without any side effects. Hence, adjunctive Pulse D therapy can be added safely to the existing treatment protocols of COVID-19 for improved outcomes.

COVID-19 pandemic caused by SARS-CoV-2 virus has created an unprecedented hardship in the recent times^{1,2}. Serious consequences of COVID-19 were attributed to the immune dysregulation leading to the enhanced production of pro-inflammatory mediators (cytokine storm)^{3–7}. In the absence of a specific vaccine or a treatment, strategies to minimize the effects of COVID-19 have become extremely important. Recent observational studies have reported that the patients with higher levels of serum vitamin D (vit.D) had less severe symptoms and vice versa and have postulated the usefulness of vit.D in prevention and treatment of COVID-19^{8–12}. The beneficial effects of vit.D in COVID-19 were attributed to be mediated through its multiple actions on the immune system. Vit.D is known to enhance the production of various anti-microbial peptides by the immune cells and vit.D modulates the immune system according to the internal milieu. It reduces the dysregulated production of self-damaging pro-inflammatory cytokines and promotes the expression of anti-inflammatory cytokines by immune cells^{13–18}. The dynamic role of vit.D can be of immense value in the context of immune dysfunction observed in COVID-19 patients with cytokine storm and acute respiratory distress syndrome^{3–6}.

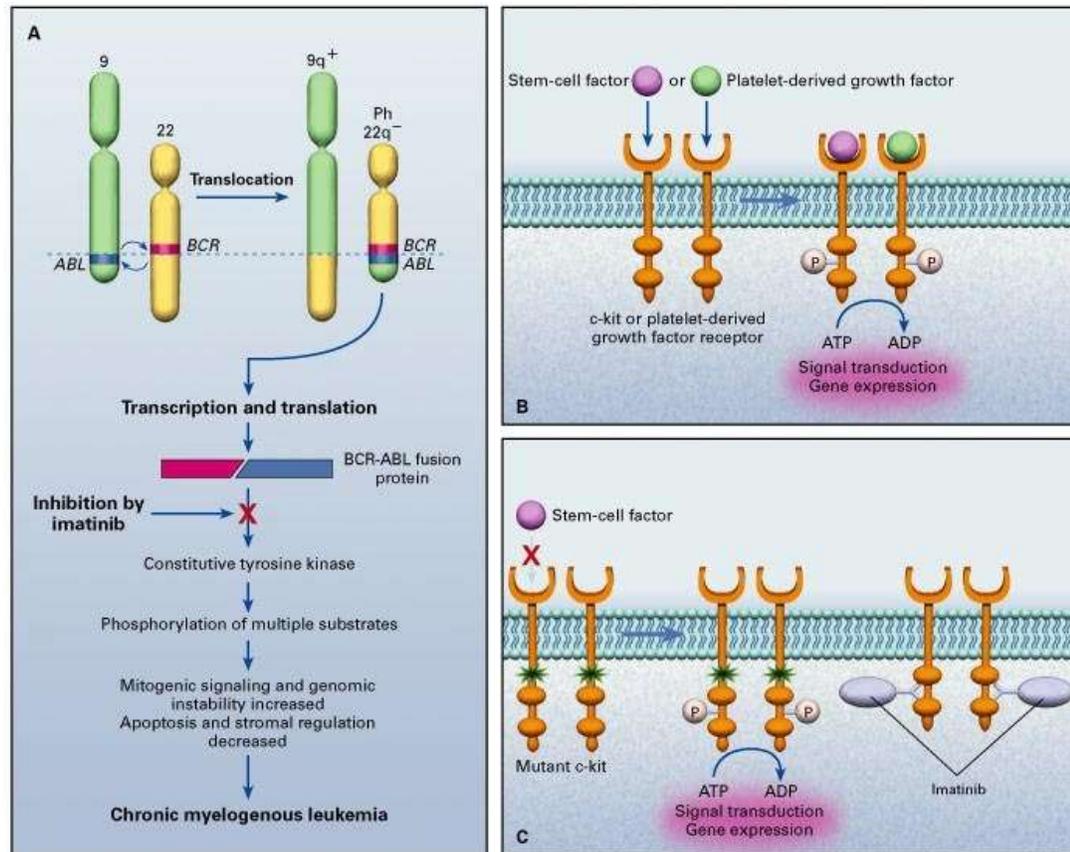

Though the protective immuno-modulatory effects of vit.D were explored in many autoimmune diseases and respiratory tract infections, there is a dearth of information from the randomised clinical trials in COVID-19.

Pulse D therapy is a targeted approach to increase the serum vit.D level by using high dose (60,000 IUs) oral supplementation of vit.D daily for a specific period of time determined by the individual's BMI, initial level of vit.D and the formulation¹⁹.

This study aims to objectively investigate the role of vit.D and the impact of Pulse D therapy in reducing the inflammatory biomarkers of COVID-19.

IMATINIB

- BCR–ABL tyrosine-kinase inhibitor
- chronic myeloid leukaemia
 - gastrointestinal stromal tumours
- antiviral properties against other β -coronaviruses in vitro by hindering the early stages of the virus lifecycle.
 - as the upregulation of genes involved in the response against viruses?
- possible immunomodulator capable of reducing pro- inflammatory cytokines, chemokines, and vascular adhesion molecules
- preventing pulmonary endothelial barrier dysfunction observed in some inflammatory conditions, which might lead to a mitigation of pulmonary capillary leak.

IMATINIB

- RCT, Netherlands
- Hospitalised patients (aged ≥ 18 years) with supplemental Oxygen
- Excluded if:
 - severe pre-existing pulmonary disease
 - pre-existing heart failure
 - undergone active treatment of a haematological or non-haematological malignancy (12 months)
 - receiving concomitant treatment with medication known to strongly interact with imatinib.
- Loading dose of 800 mg on day 0 followed by 400 mg daily on days 1–9, or placebo.
- Imatinib group (n=204) or placebo group (n=196).

CONCLUSIONS

No magic bullet but probably the combination of timely and tailored interventions according to the risk of progression, phase of disease and extrapulmonary involvement

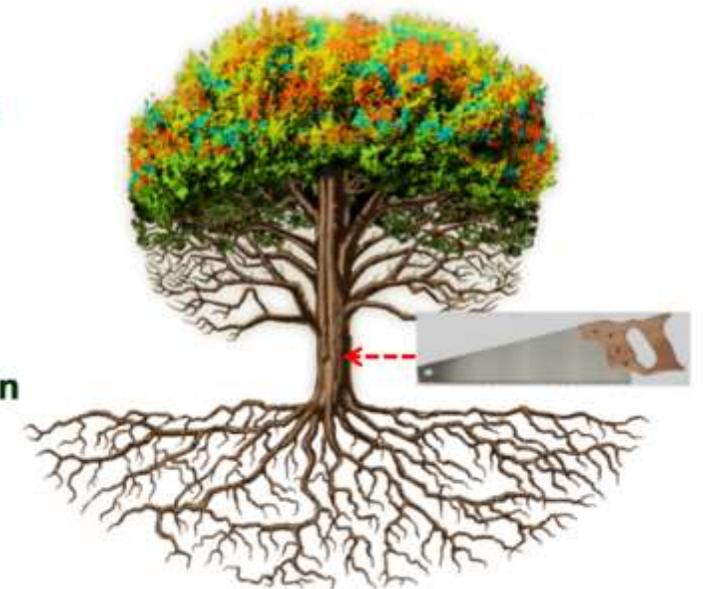

- Dexamethasone 6 mg 5-10 days
- Tocilizumab 8 mg/Kg (one/two doses?)
- Anakinra in high-risk patients (not on NIV/IV)
- Baricitinib (early? late?)

Can we find the tree trunk?

Branches
Inflammation
Coagulation
Lymphoid Fibrosis

Trunk
IL-1b
Jak/Stat
IDO-1
Monocyte activation

Roots
HIV reservoirs
CMV
Microbial translocation

CONCLUSIONS

No magic bullet but probably the combination of timely and tailored interventions according to the risk of progression, phase of disease and extrapulmonary involvement

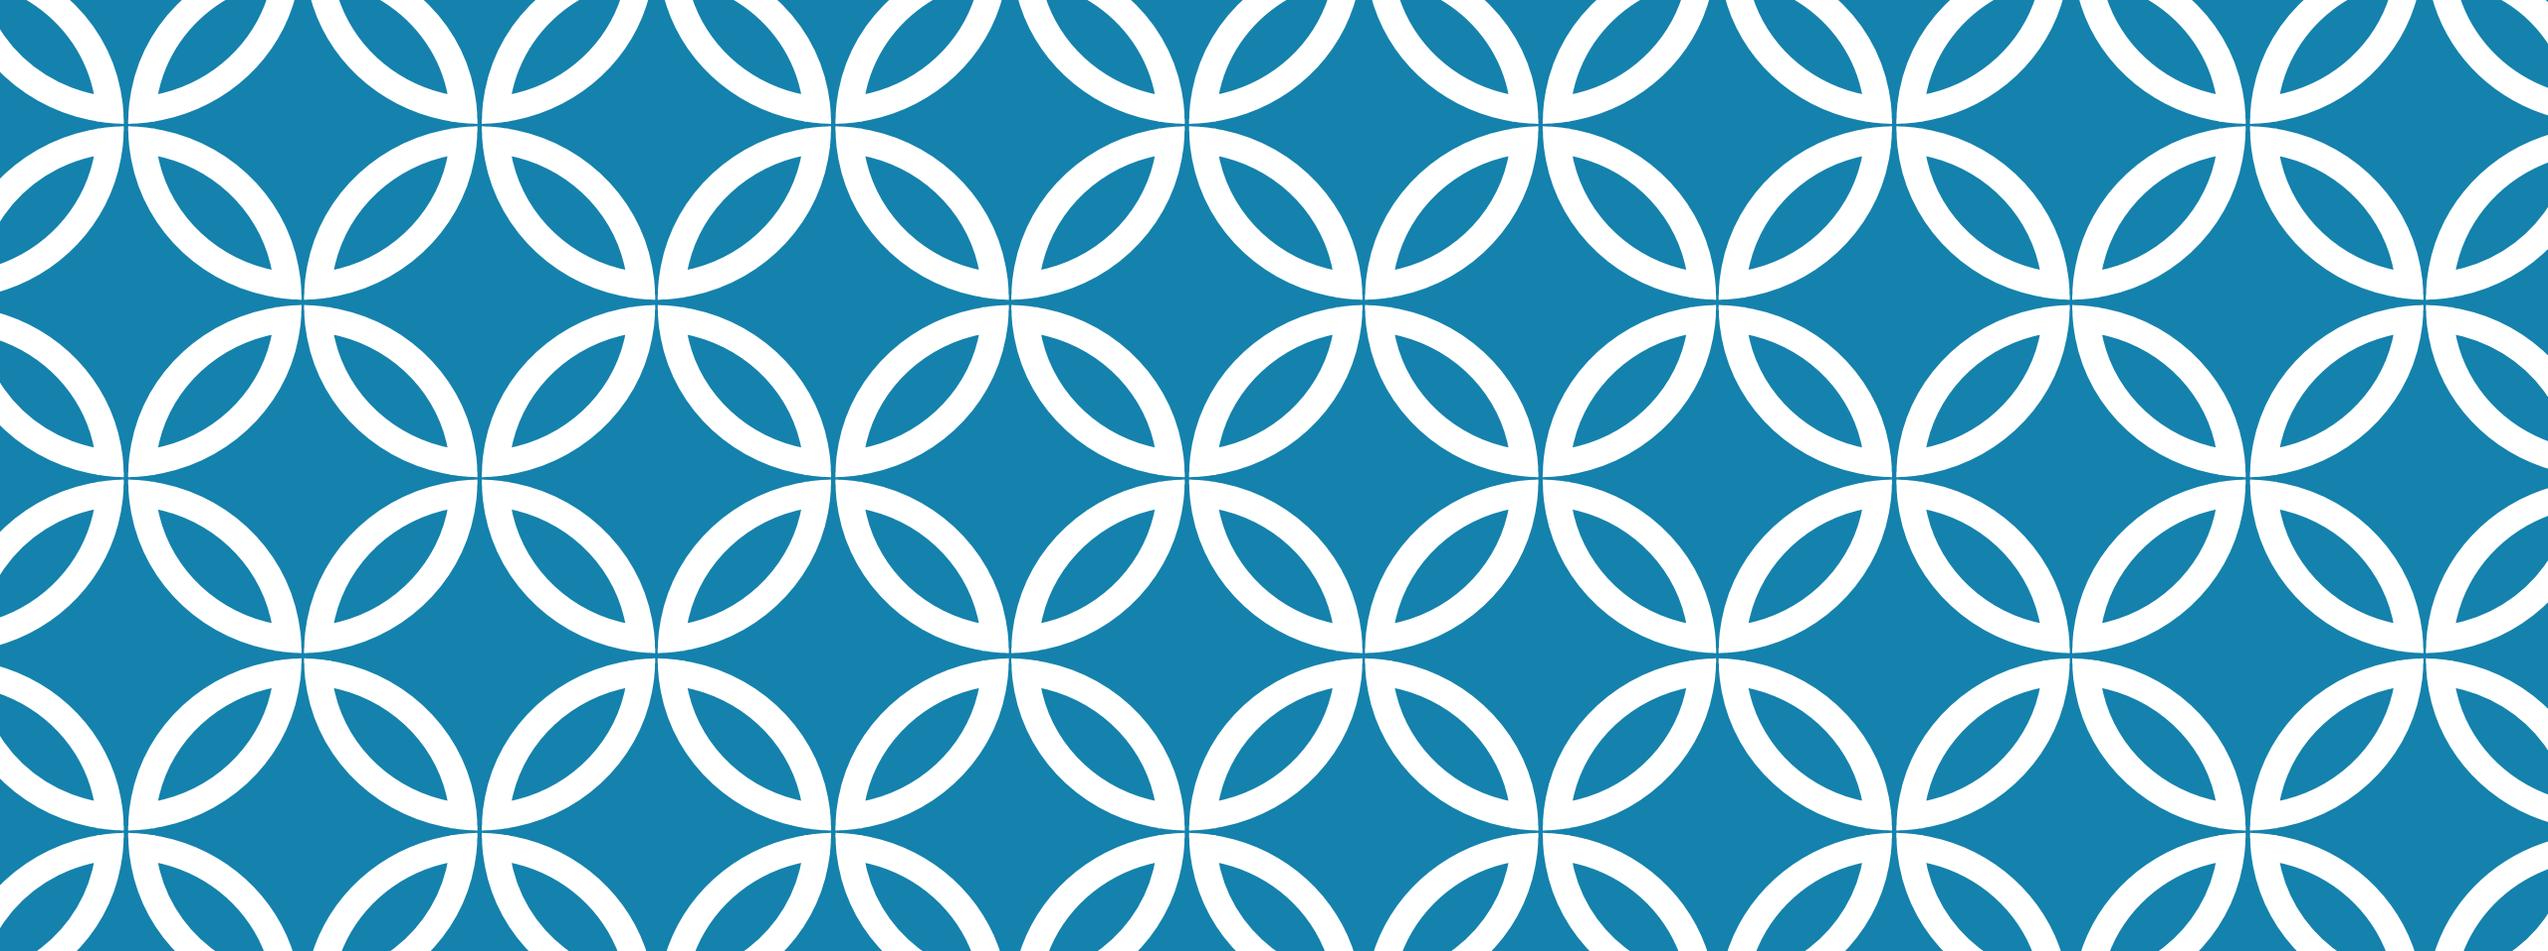

- Dexamethasone 6 mg 5-10 days
- Tocilizumab 8 mg/Kg (one/two doses?)
- Anakinra in high-risk patients (not on NIV/IV)
- Baricitinib (early? late?)

Several ongoing RCTs

Need accurate and careful evaluation of setting, methods and results

Open Questions

- Dose and choice of corticosteroids (vs. dexamethasone 6 mg as SOC)
- Anti-IL6 vs. anti IL-1 vs. JAK-i?
- Are the available data enough to widely use colchicine in outpatients?
- High-dose calcifediol?

THANK YOU FOR YOUR ATTENTION
