Forgiveness

- Suboptimal adherence may lead to inadequate ARV exposure, virological failure, and drug resistance
- Pharmacokinetic forgiveness is the difference between the duration of beneficial action after dosing and the prescribed dosing interval.
- ARV forgiveness relates to the number of doses that can be missed without causing viral relapse.
- Forgiveness in the context of missed doses is possible when either the elimination half-life of a drug or its inhibitory effect exceeds the recommended dosing interval.

Pharmacokinetic of representative patients during a QD or BID dosing regimen . The consequences of missing one QD or three BID doses are illustrated

Forgiveness is a piece of puzzle of virological success with

- potency,
- adherence,
- genetic barrier.

Pharmacokinetic of representative patients during a QD or BID dosing regimen . The consequences of missing one QD or three BID doses are illustrated

Review
Tribute to John C. Martin at the Twentieth Anniversary of the Breakthrough of Tenofovir in the Treatment of HIV Infections

Erik De Clercq 

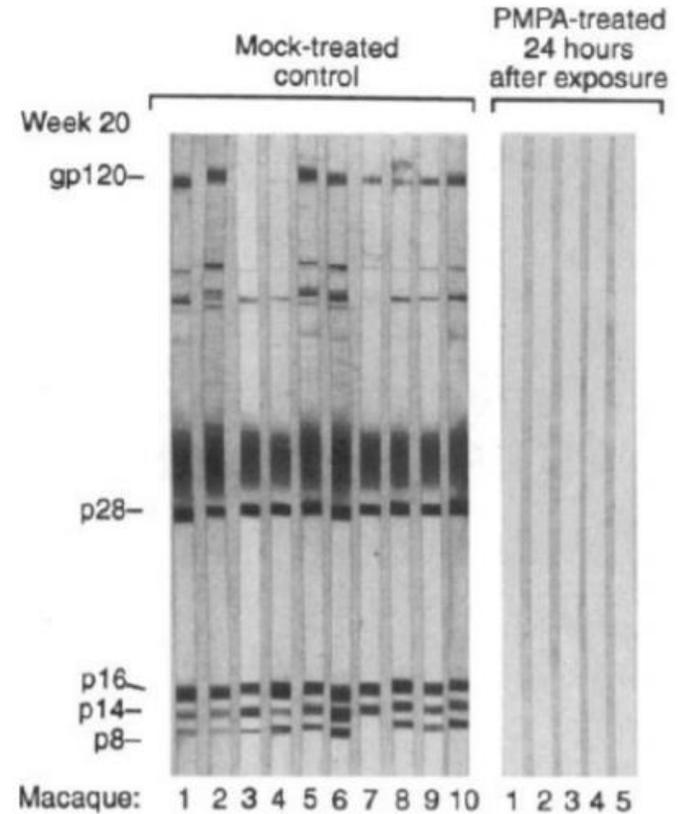

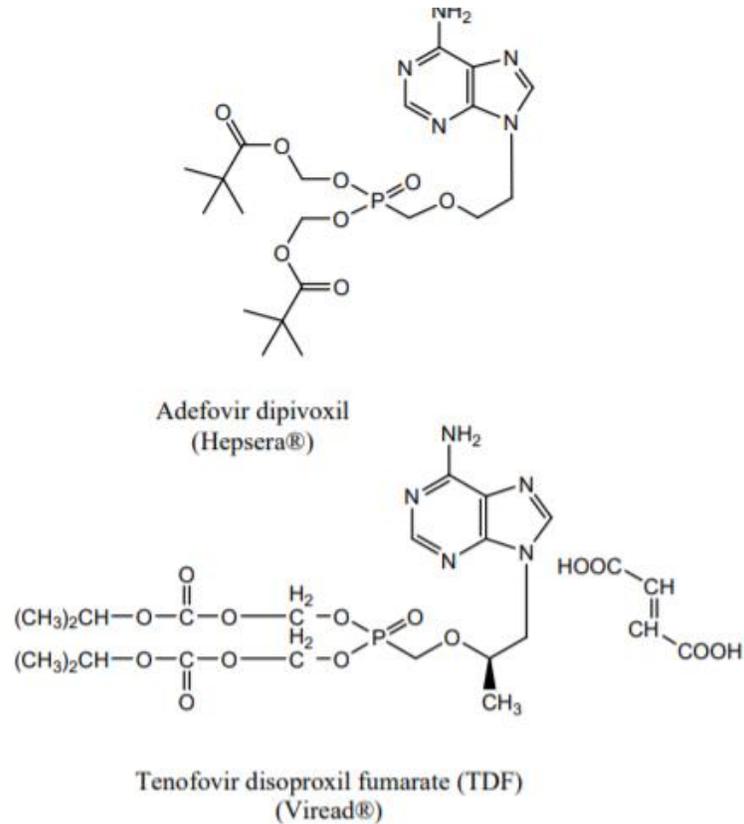

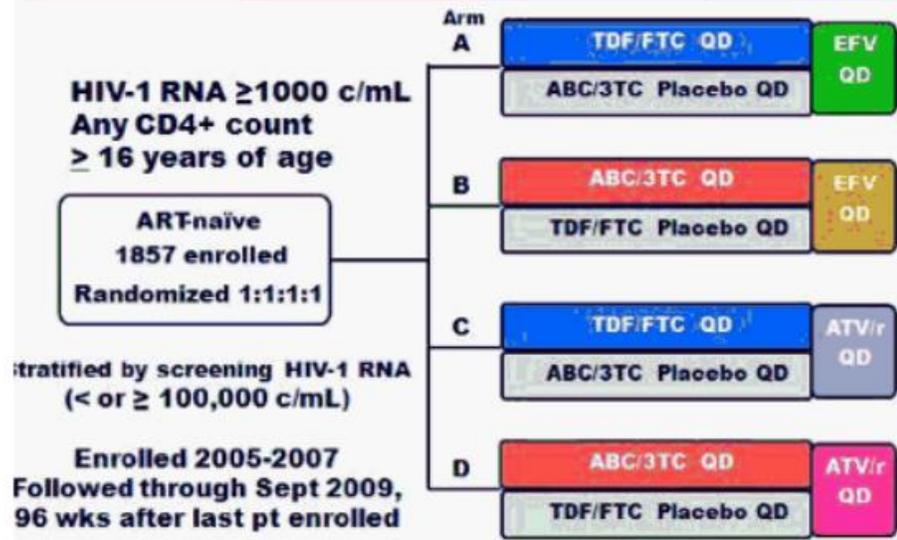

Figure 3. Activity of (R)-PMPA when injected shortly before or after SIV infection in rhesus : first prediction that tenofovir may be effective in therapy and prophylaxis of HIV infection i (figure taken from Tsai et al. [34]).

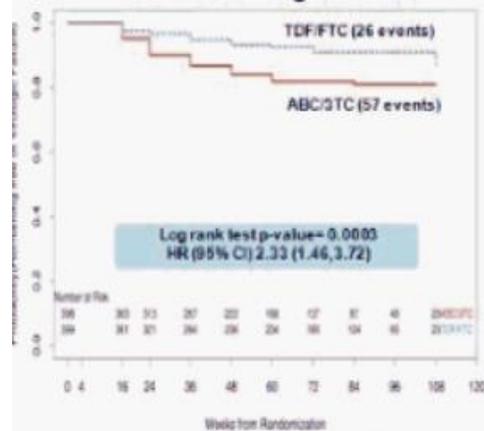

A5202: Study Design

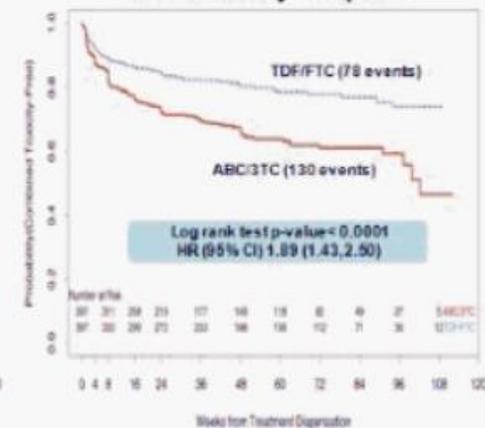

ABC/3TC vs. TDF/FTC Primary Virologic and Safety Endpoints (High Viral Load Stratum at DSMB Action)

N=797; median (25th, 75th) follow-up = 60 weeks (28, 84)

Time to Virologic Failure

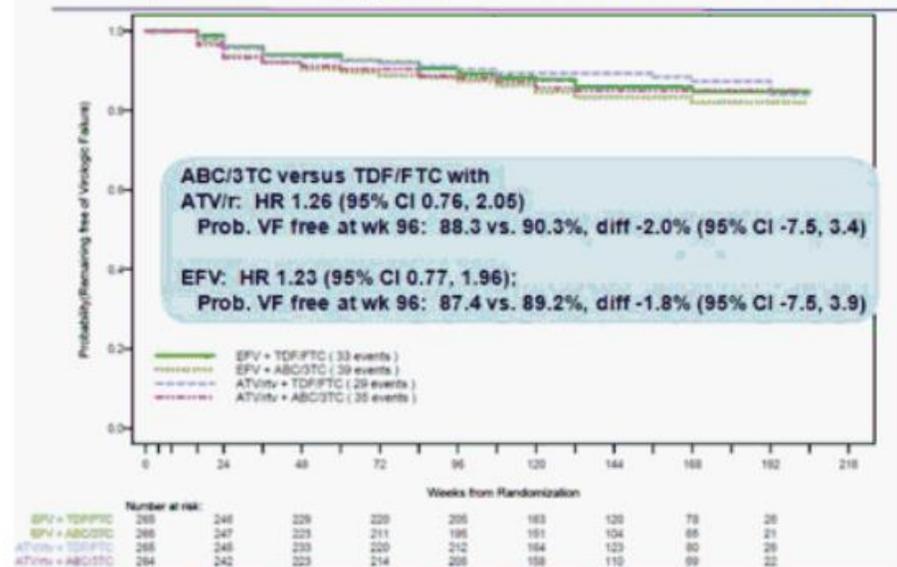

Time to Safety Endpoint

 Jia-Hua Zheng,⁴ Lucas Ellison,⁴ Lane R. Bushman,⁴ Jennifer J. Kiser,⁴
 Samantha MaWhinney,³ and Peter L. Anderson⁴

| | | | |
|-------------------------------------|-------------------|-------------------|-------------------|
| TFV-DP (fmol/punch) Median (IQR) | 1731 (1269, 2377) | 1814 (1393, 2582) | 2601 (2199, 3054) |
|-------------------------------------|-------------------|-------------------|-------------------|

Drug concentrations of phosphorylated antiretroviral anabolites in dried blood spots (DBS) have been used to assess adherence

- **TFV-DP in DBS** is a measure of cumulative TFV adherence and exposure, given its long half-life of 17 days in red blood cells, informing about TDF intake over **the preceding 8 weeks**
- **FTC-TP in DBS** is informative of **recent dosing** due to its shorter half-life of 35 h in red blood cells

Strategies for improving compliance

...therefore, which is nowadays the adherence threshold for virological success?

Forgiveness of Dolutegravir-Based Triple Therapy Compared With Older Antiretroviral Regimens: A Prospective Multicenter Cohort of Adherence Patterns and HIV-RNA Replication

Parienti et al., Open Forum Infectious Diseases 2021

- 399 experienced PWH
- DOLUTECAPS study, international multicenter prospective cohort from May 2015 and December 2018
- Electronic drug monitoring (EDM)

- Inclusion PWH at risk of suboptimal adherence was encouraged
- Exclusion: people using pillbox organizers and PWH not responsible for taking pills

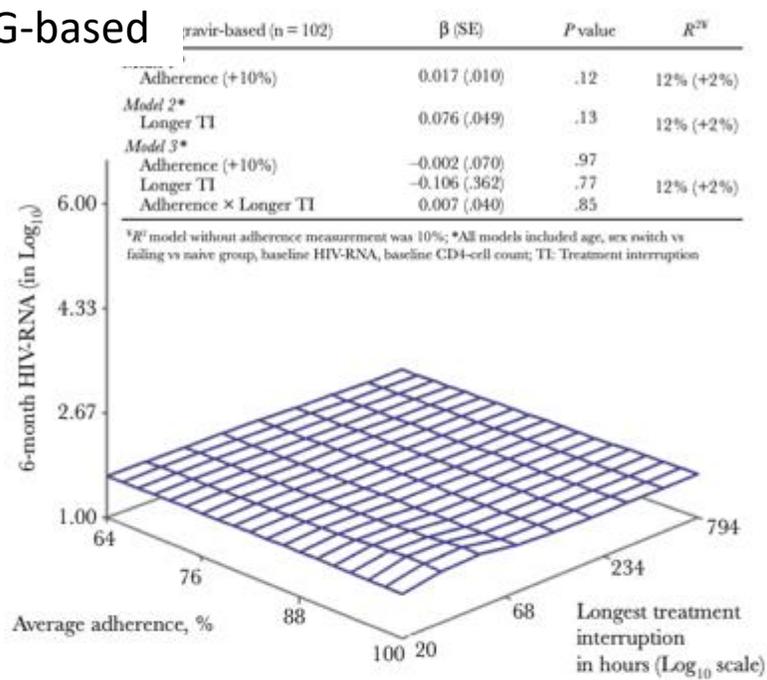

- 3 groups: STARTING group, FAILING group, SWITCHING group

Table 2. Factors Associated With Virological Replication (>50 Copies/mL) at Month 6 in the Overall Cohort (n = 399)

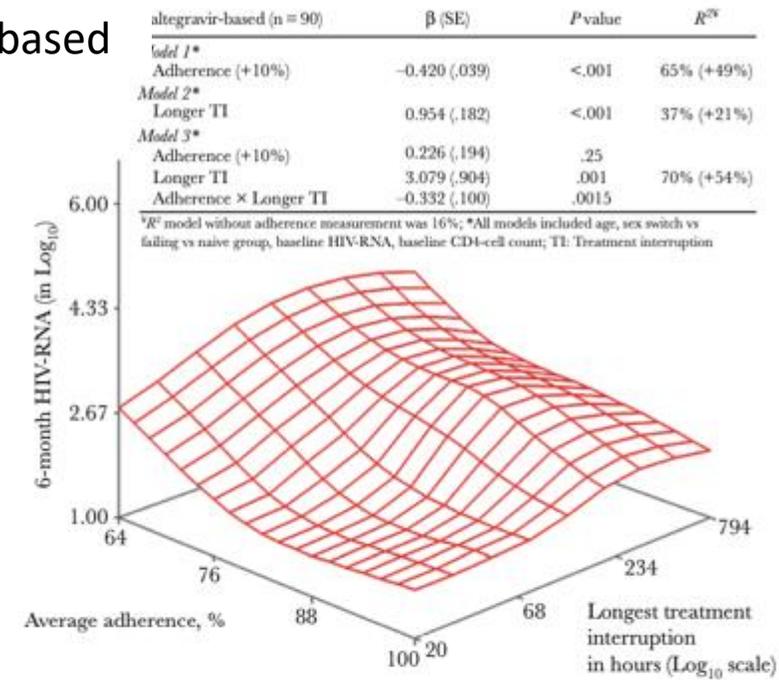

| Variables | Univariate Analysis | | | Multivariate Analysis | |

Dissociation Kinetics & In Vitro Resistance Profile and G140S+Q148H Mutant Integrase-DNA Complexes¹

- Longer dissociation half-life is predicted to correlate with more potent antiviral activity and a potentially higher genetic barrier to resistance

Phenotypic Analysis of Clinical Isolates* G140S/Q148H ± Other INSTI-R (n=16)

| INSTI | Fold-Change vs WT [†] | % of Isolates with EC ₅₀ FC ≤4.0 [‡] | P-value vs BIC |
|-------|--------------------------------|--|----------------|
| RAL | >143 | 0% | <0.001 |
| EVG | >150 | 0% | <0.001 |
| DTG | 7.6 ± 4.3 | 25% | <0.001 |
| BIC | 3.4 ± 1.7 | 75% | -- |

* Patient-derived clinical isolates with INSTI-R (Monogram Biosciences).

[†] Mean ± standard deviation.

[‡] The lower clinical cut-off for reduced susceptibility to DTG on the PhenoSense IN assay is 4-fold.

BIC was associated with longest dissociation half-life from wild-type and G140S/Q148H integrase mutants and greater in vitro phenotypic activity against G140S/Q148H integrase mutants

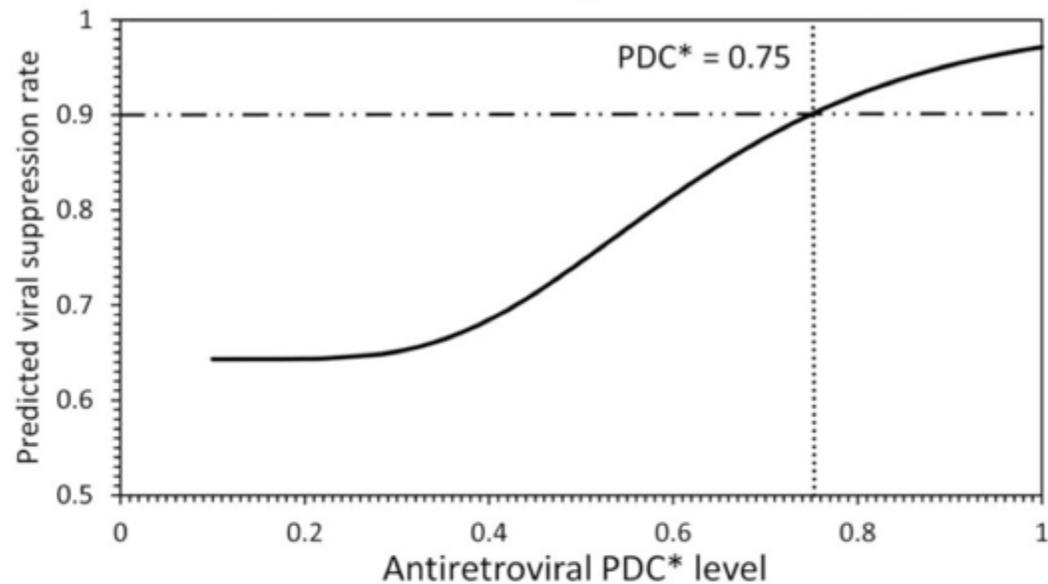

EC, effective concentration; FC, fold change; ND, not detected; T_{1/2}, half-life

Antiretroviral Adherence Level Necessary for HIV Viral Suppression Using Real-World Data

Byrd et al., J Acquir Immune Defic Syndr. 2019

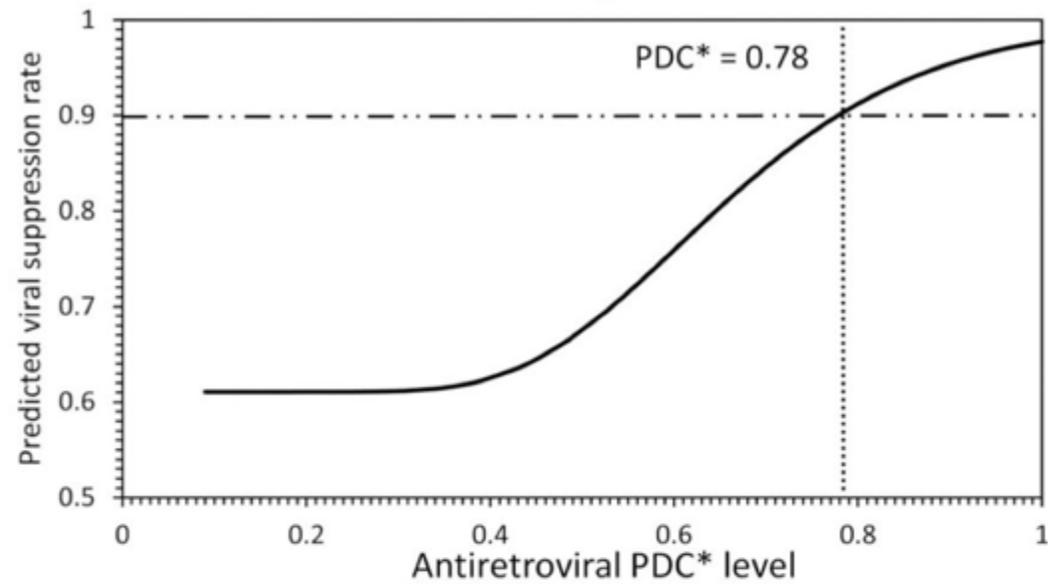

- Lower adherence level of $\geq 90\%$ has been set by the Pharmacy Quality Alliance.
- Given the enhanced pharmacokinetic profiles of newer ARV medications, even the lower adherence level of $\geq 90\%$ may not be necessary to achieve HIV viral suppression
- Patient-centered HIV Care Model (PCHCM) PCHCM project partnered community-based HIV-specialty pharmacists with HIV medical providers and required the partnered pharmacists and medical providers to share patient clinical information, identify therapy-related problems, and develop therapy-related action plans.
- 765 adult pts in United States from 2014 to 2016.
- The PDC: proportion of days covered

INSTI-based regimens^{‡,¶}

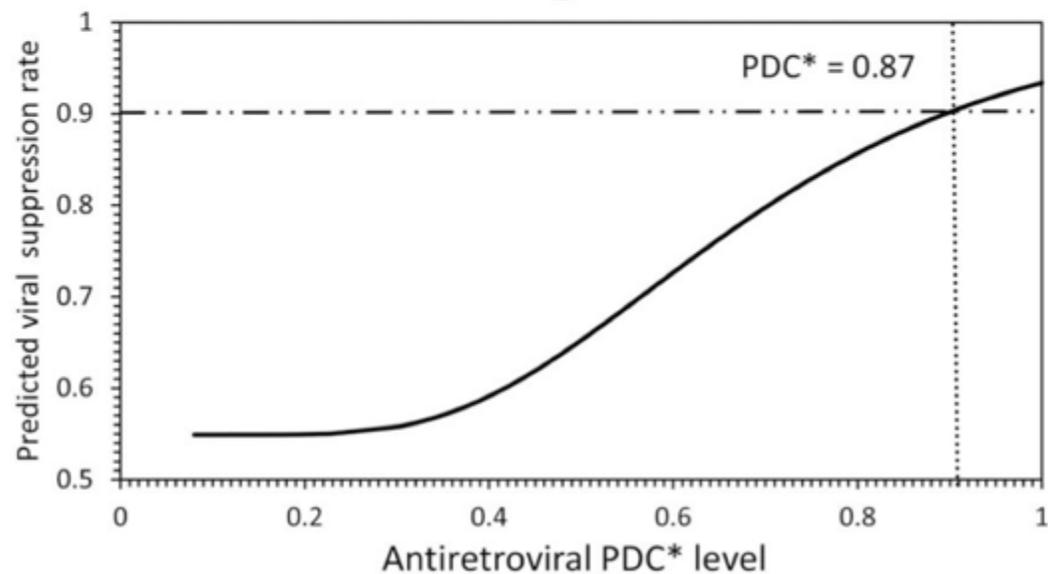

$$Pr(\text{suppressed}) = 0.6459 + 0.3541(\Phi(1.4255 + 6.766 * \log_{10}(PDC)))^{\dagger}$$

NNRTI-based regimens^{§,¶}

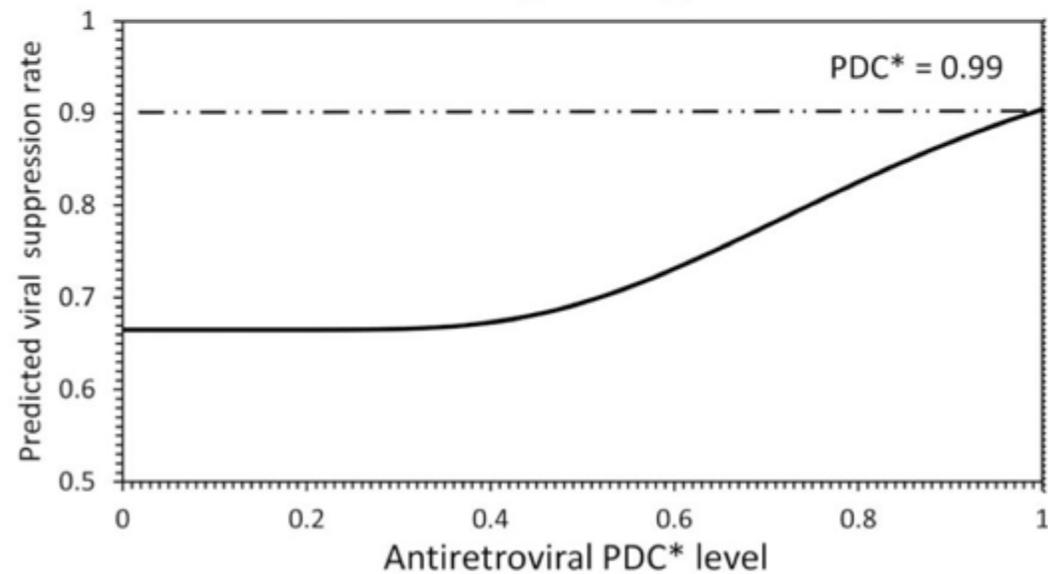

$$Pr(\text{suppressed}) = 0.6104 + 0.3896(\Phi(1.5635 + 8.3937 * \log_{10}(PDC)))^{\dagger}$$

PI-based regimens^{||,¶}

$$Pr(\text{suppressed}) = 0.5665 + 0.4335(\Phi(1.0791 + 5.8251 * \log_{10}(PDC)))^{\dagger}$$

"All other" regimen types^{**}

$$Pr(\text{suppressed}) = 0.6745 + 0.3255(\Phi(0.5422 + 6.608 * \log_{10}(PDC)))^{\dagger}$$

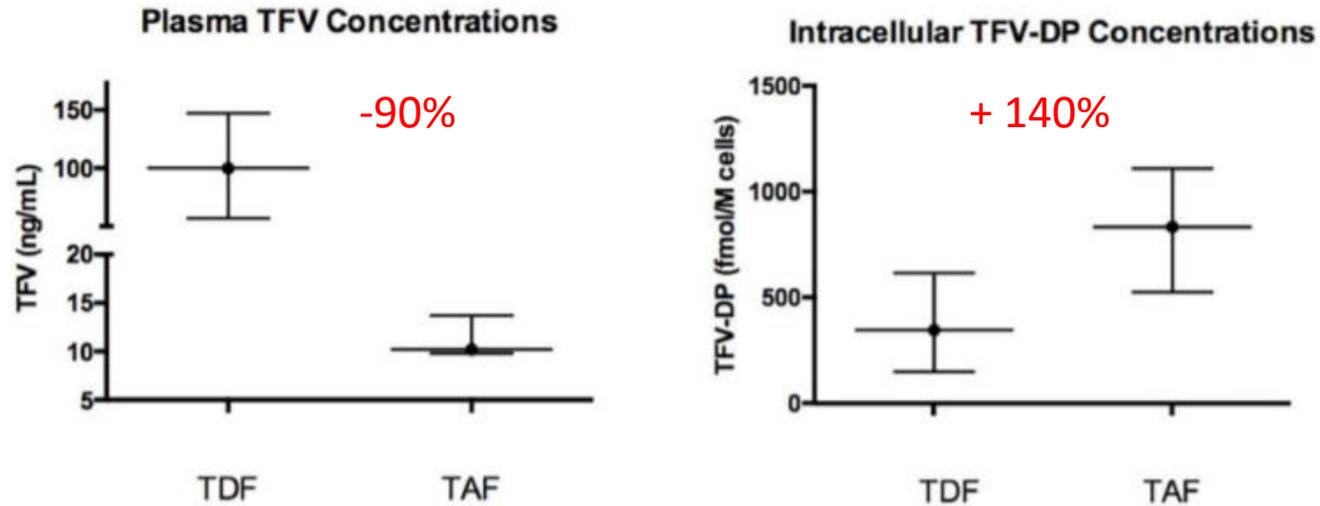

Figure 1. Whisker plot of plasma tenofovir and PBMC tenofovir diphosphate concentrations during TDF and TAF based dosing. Data presented as 25th, 50th and 75th percentiles.

Tenofovir-diphosphate in peripheral blood mononuclear cells during low, medium, and high adherence to F/TAF vs. F/TDF (Yager, AIDS sept 2021)

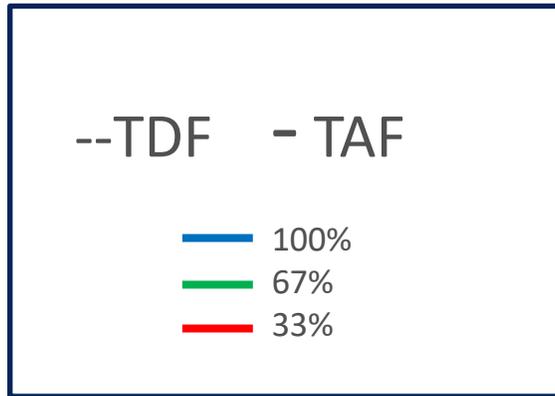

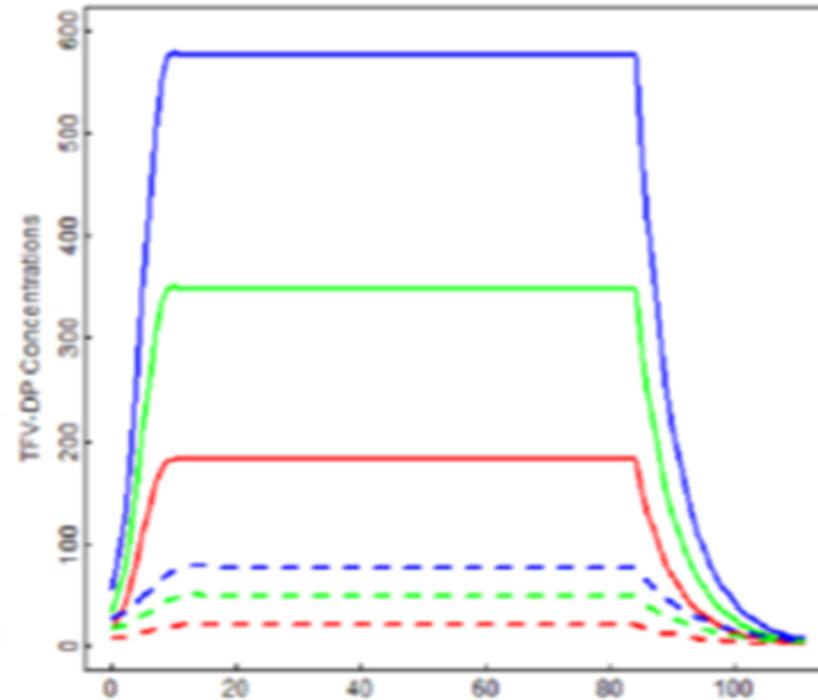

Figure Legends:

Figure 1. Predicted TFV-DP concentrations in PBMC following F/TDF and F/TAF. Model-fitted TFV-DP in PBMC (fmol/ 10^6 cells) by study day for 33% dosing (red), 67% dosing (green) and 100% dosing (blue). Solid lines are concentrations following F/TAF dosing; dashed lines are concentrations following F/TDF dosing. Prior to steady state, a nonlinear mixed effect model with tensor product of natural b-spline transformation of study day and study arm was used to model concentrations. The estimate was constant over time at steady state, and then an exponential decay was modeled during washout.

Does increased intracellular TFV-DP matter?

| → 5 TAMs + M184V | 2 | 3.8 (0.6) | 4.3 (0.8) | >82 (12.6) | 8.3 (1.5) | >126 (0) | 0.9 (0.4) | 1.0 (0.2) | |

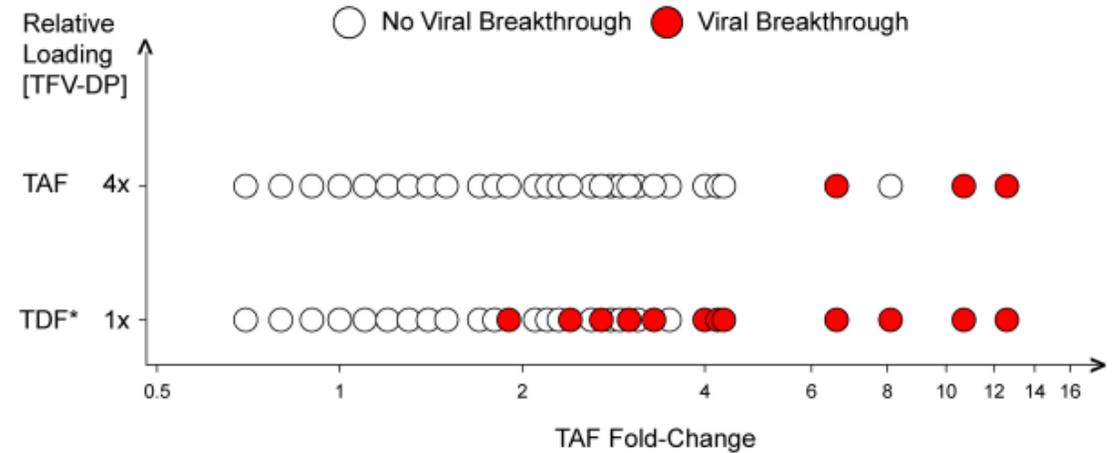

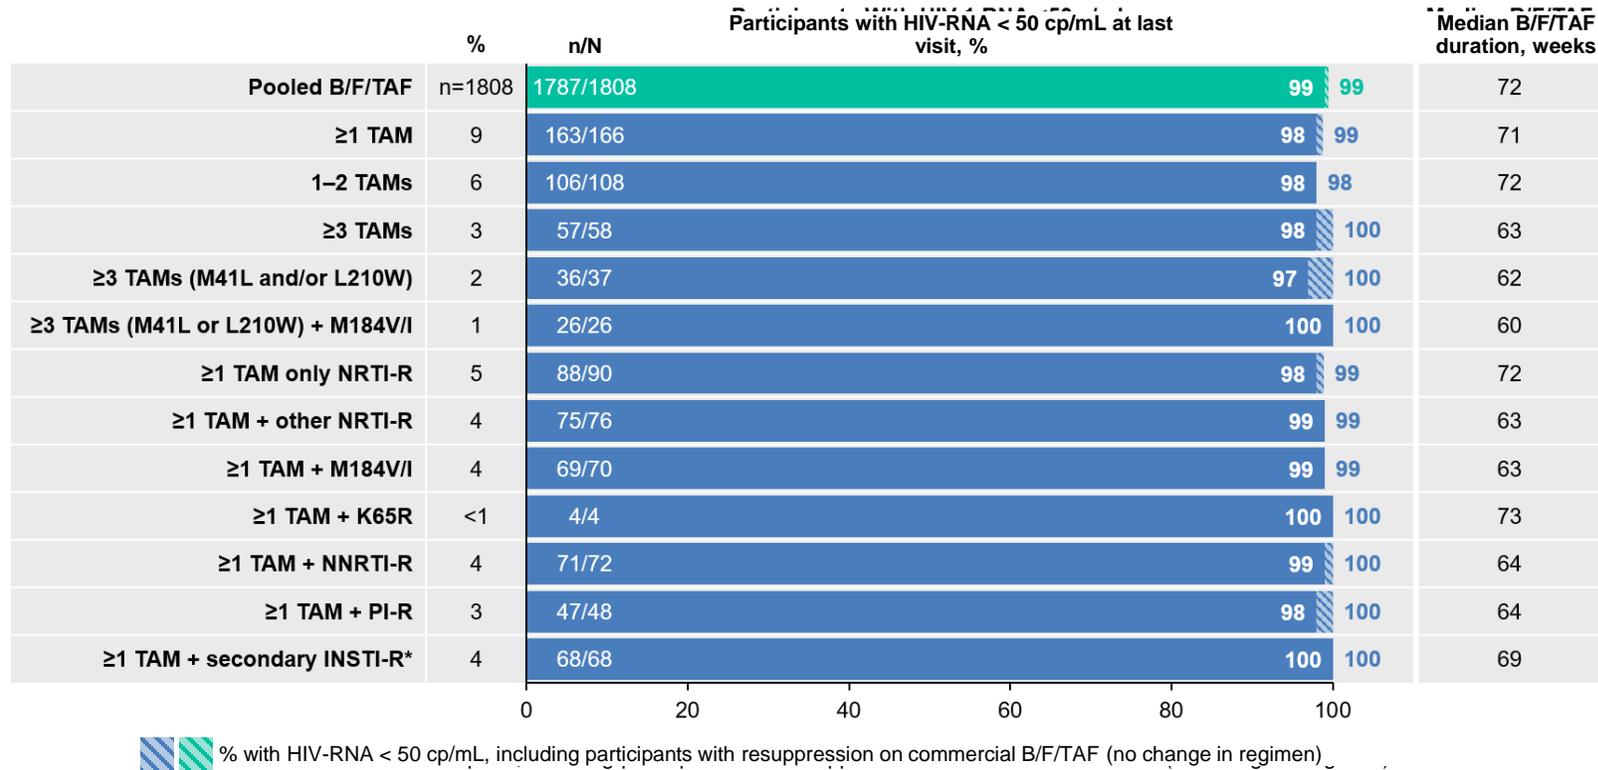

FIG 5 Viral breakthrough of selected viruses ($n = 68$, see the supplemental material) in the presence of physiological concentrations of TAF and TDF. MT-2 cells were incubated overnight with either TDF or TAF at concentrations reflective of *in vivo* loading achieved with the two prodrugs of TFV (TDF, $50 \mu\text{M}$ [$1 \times \text{EC}_{95}$ corresponding to an $\text{IQ}_{95} = 1$]; TAF, $0.8 \mu\text{M}$ [$4 \times \text{EC}_{95}$ corresponding to an $\text{IQ}_{95} = 4$]) and infected with HIV-1 mutants. Mutant viruses tested (each represented by a circle) are plotted against the TAF EC₅₀-fold changes measured for the mutants. *, TFV, the *in vitro* equivalent of TDF, was used in these experiments.

The 4-fold increase in intracellular TFV-DP concentration upon dosing with TAF compared to TDF is associated with an **increase in the resistance threshold** for TAF compared to TDF

Pooled analysis: Studies 4030, 4580, 1844, 1878 and 4449

Virologic Outcomes by Pre-existing TAMs: Last On-treatment Study Visit

High rates of virologic suppression were maintained through 72 weeks after switching to B/F/TAF, regardless of pre-existing TAMs

*No participants with ≥ 1 TAM and primary INSTI-R received B/F/TAF
 R, resistance; TAM, thymidine analog mutation
[Andreatta K, et al. EACS 2021, Poster PE1/6](#)

Does increased intracellular TFV-DP matter?

3- Forgiveness?

Forgiveness Simulation Model¹

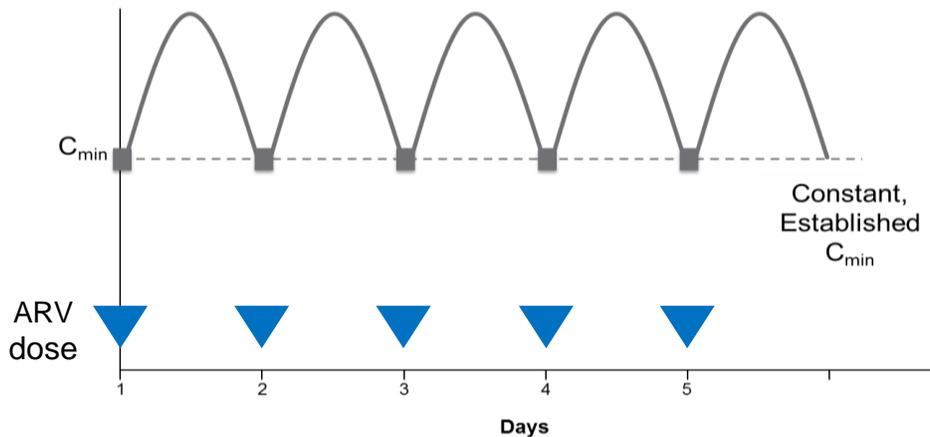

In vitro

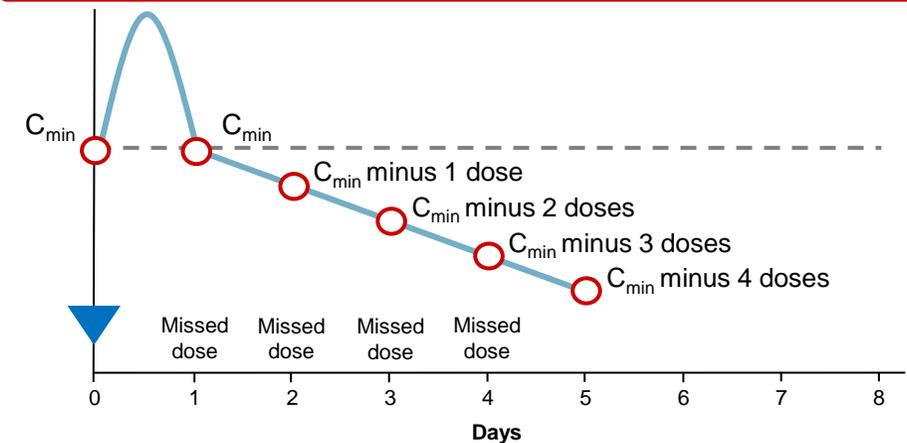

Outcome

In vitro simulation of drug C_{min} pharmacokinetics, and the effect of two and four consecutive missed daily oral doses

Optimal Adherence

With 1–4 Consecutive Missed Doses

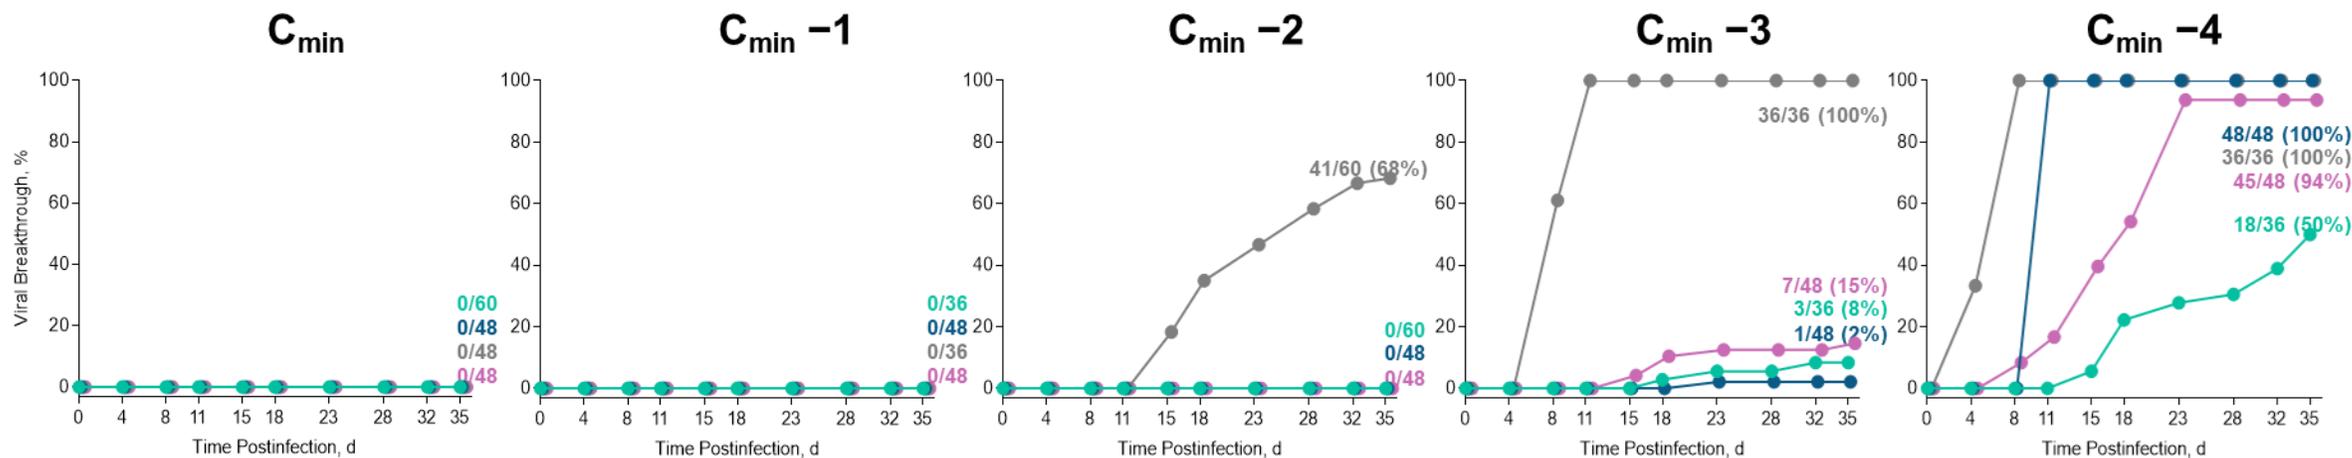

- Drug resistance occurs when HIV is replicating in the presence of suboptimal concentrations of drugs²
- Although short lapses in adherence to ARV drugs can lead to virologic failure and emergence of drug resistance, certain drug regimens have high levels of forgiveness²
- There is potential for resistance development associated with low drug exposure, inconsistent dosing, pre-existing drug resistance or HIV-1 subtype³

Viral Breakthrough *In Vitro*

MT-2 cells were infected with HIV-1 IIIb; cultured in the presence of fixed concentrations of BIC+FTC+TAF, DTG+FTC+TAF, DTG+3TC, or DTG+RPV, and monitored for viral breakthrough

■ BIC + FTC + TAF ■ DTG + FTC + TAF ■ DTG + 3TC ■ DTG + RPV

Viral breakthroughs were seen for all regimens but at different frequencies and time of onset; BIC+FTC+TAF had no breakthrough until $C_{min} -3$

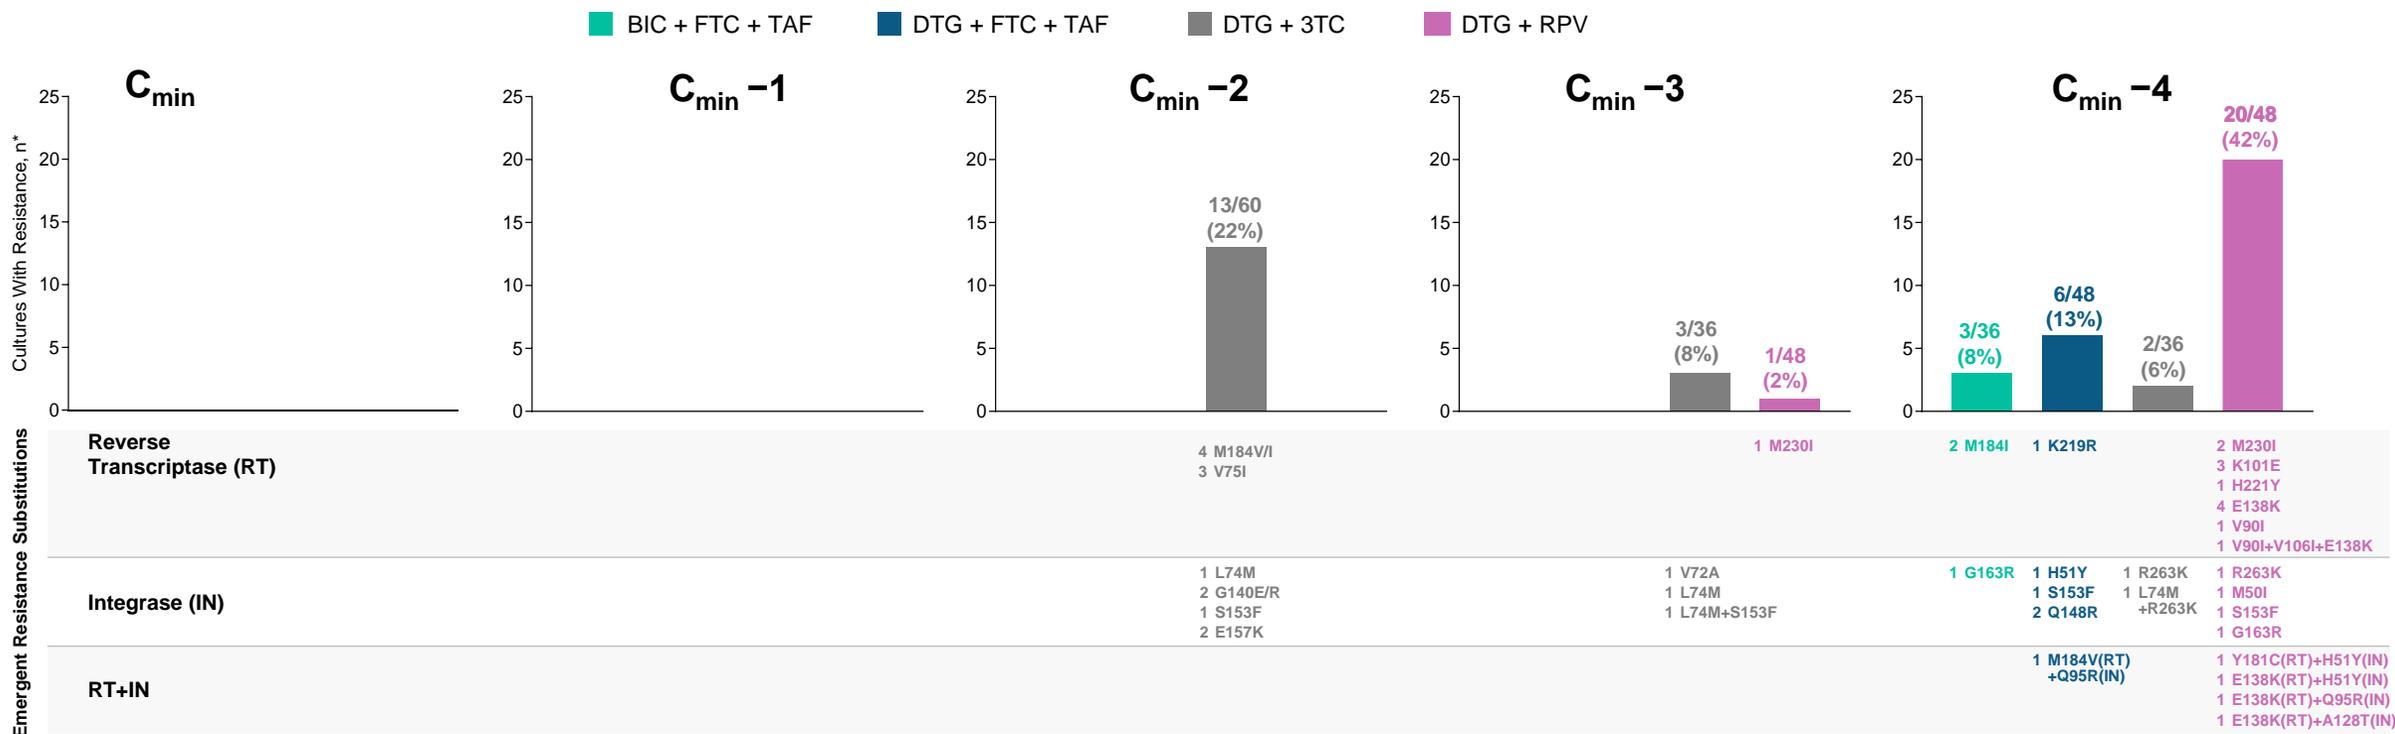

In vitro viral breakthrough experiments should be analyzed comparatively; controlled clinical trials assessing the impact of missed doses of these ARV combinations have not been conducted

C_{min} , minimum concentration

Acosta R, et al. EACS 2021, Poster PE1/10; Acosta R, et al. IDWeek 2021, Poster 888

Resistance Development *In Vitro*

Deep sequence was performed in virus recovered at the time of breakthrough to identify emergent drug resistance

Emergent drug resistance was seen for all regimens occurring at differing frequencies and time of onset; there was no resistance for BIC+FTC+TAF at $C_{min} -3$, emergence occurred at $C_{min} -4$

*Cultures with resistance contained 1 or more known resistance-associated substitutions
 C_{min} , minimum concentration
[Acosta R, et al. EACS 2021, Poster PE1/10](#); Acosta R, et al. IDWeek 2021, Poster 888

..due to availablility of effective 2DRs, do we still need of TAF/TDF-related forgiveness?

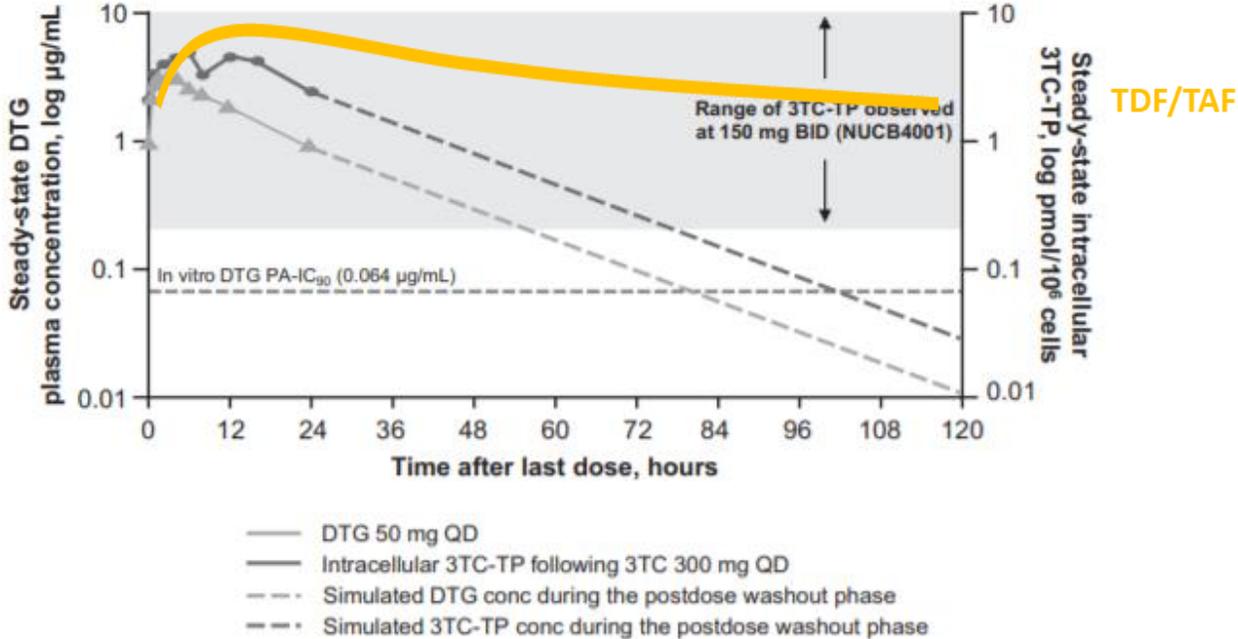

DTG and 3TC Have Complementary PK Profiles

BARRIER TO ANTIRETROVIRAL RESISTANCE

15

FIG. 1. Steady-state DTG and intracellular 3TC-TP concentration-time profiles after administration of DTG 50 mg or 3TC-TP 300 mg daily.^{34,41,42} BID, twice daily; conc, concentration; DTG, dolutegravir; PA-IC₉₀, protein-adjusted 90% inhibitory concentration; QD, once daily; 3TC-TP, lamivudine triphosphate.

The PK profiles of DTG and 3TC are well matched. Adequate plasma concentrations of DTG and intracellular concentrations of 3TC-TP are maintained for 3 days after the last dose

IMPACT OF TREATMENT ADHERENCE ON EFFICACY OF DTG + 3TC AND DTG + TDF/FTC: POOLED ANALYSIS OF THE GEMINI-1 AND -2 CLINICAL STUDIES

Mounir Ait-Khaled,¹ Juan Sierra Madero,² Vicente Estrada Perez,³ Roberto Gulminetti,⁴ Debbie Hagins,⁵ Hung-Chin Tsai,⁶ Choy Man,⁷ Jörg Sievers,¹ Rimgaile Urbaityte,⁸ Richard Grove,⁸ Andrew Zolopa,⁷ Brian Wynne,⁷ Jean van Wyk¹

Methods

- **Association between adherence and proportion of participants with HIV-1 RNA <50 c/mL was evaluated at Week 48** using the **FDA Snapshot algorithm** and an analysis based on the **last available on-treatment viral load by Week 48** (assessment of virologic response not accounting for discontinuations for non-virologic reasons)
- **Percent adherence** calculated as:
 - **number of pills taken** (difference between the number of pills available and the number of pills returned) **per number of pills prescribed estimated using pill count data**
- Participants were **stratified by ≥90% vs <90% adherence**
- Unadjusted treatment differences with exact 95% CIs were derived for proportion of participants with HIV-1 RNA <50 c/mL using both FDA Snapshot endpoint and last available on-treatment viral load through Week 48

Adherence Results in GEMINI-1 and -2 (ITT-E Population)

- Baseline HIV-1 RNA and CD4+ cell counts were comparable across adherence categories

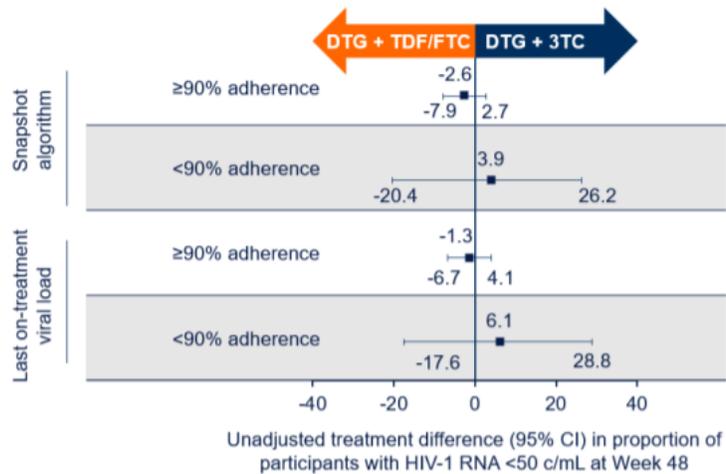

| Adherence results | DTG + 3TC (N=716) | DTG + TDF/FTC (N=717) |
|--|----------------------|--------------------------|
| Adherence category, n (%) ^a | | |
| <90% | 35 (5) | 34 (5) |
| ≥90% | 679 (95) | 677 (94) |
| HIV-1 RNA by adherence category, median (range), log ₁₀ c/mL | | |
| <90% | 4.39 (2.82-5.75) | 4.35 (3.07-5.88) |
| ≥90% | 4.43 (1.59-6.27) | 4.48 (2.11-6.37) |
| CD4+ cell count by adherence category, median (range), cells/mm ³ | | |
| <90% | 407.0 (41-1399) | 415.0 (19-929) |
| ≥90% | 427.0 (19-1364) | 440.0 (19-1497) |

- A high proportion of participants had complete data records for the assessment of treatment adherence
- **In each treatment group, 5% of participants had <90% adherence**
- Demographics and baseline characteristics of participants in GEMINI-1 and -2 were well balanced between treatment groups^{1,2}

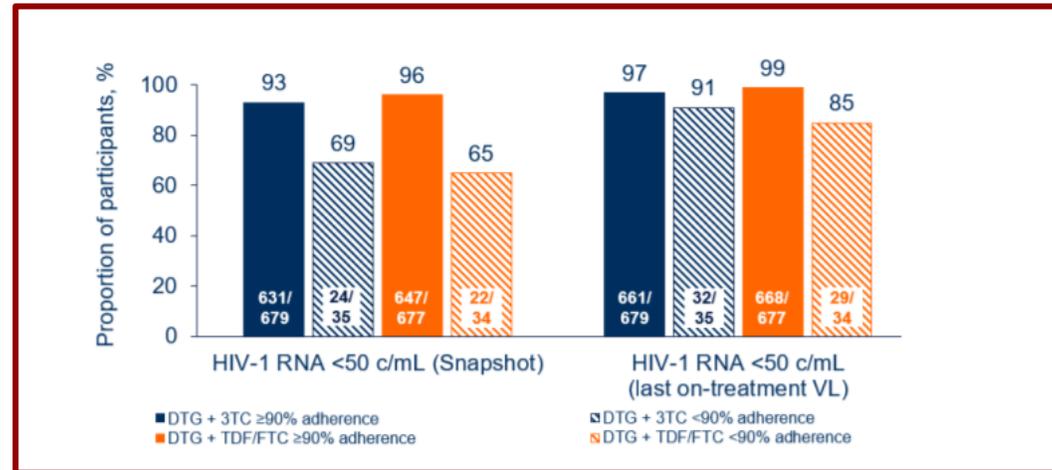

^aAdherence categories only include participants with derived study drug adherence data.

Response Rates Were High in Participants With ≥90% Adherence, and Impact of Adherence Was Similar Between Treatment Groups

- The proportion of participants with HIV-1 RNA <50 c/mL at Week 48 was lower in those with <90% adherence compared with those with ≥90% adherence, regardless of treatment regimen

1. Cahn et al. *Lancet*. 2019;393:143-155. 2. Cahn et al. *J Acquir Immune Defic Syndr*. 2020;83:310-318.

Snapshot Outcomes by Adherence Category

| Outcomes, n (%) | DTG + 3TC | | DTG + TDF/FTC | |
|--|-----------------|----------------|-----------------|----------------|

| On study but missing data in window | 2 (<1) | 0 | 0 | 0 |

Ait-Khaled et al. IDWeek 2020™; Virtual. Poster 1024.

Discussion

- In this study, ***adherence level appeared to have a similar impact on the 2DR and 3DR***; overall, response rates were high in those with $\geq 90\%$ adherence
 - Response rates were high in participants with $< 90\%$ adherence when last on-treatment VL was assessed
 - The high rates of response across adherence categories is supported by a real-world database analysis that suggests $\geq 80\%$ adherence as a threshold for achieving virologic suppression¹
- **Limitations of this analysis include the small number of participants in the lower adherence** subgroup and the difficulty in accurately measuring adherence²

Conclusions

- In the GEMINI studies, a lower proportion of participants with $< 90\%$ adherence achieved HIV-1 RNA < 50 c/mL at Wk 48 regardless of regimen
- The impact of lower adherence on virologic response was similar between treatment groups
- These results provide additional information about the robustness of DTG + 3TC compared with 3-drug DTG-containing regimens and suggest similar regimen forgiveness

1. Byrd et al. *J Acquir Immune Defic Syndr*. 2019;82:245-251. 2. Altice et al. *Patient Prefer Adherence*. 2019;13:475-490.

Real life scenarios where comparative forgiveness of 2DRs and 3DRs still needs to be investigated

- ✓ Naive pts with very high VLs and low CD4+
- ✓ Unavailability of GRT (e.g. rapid HAART)
- ✓ Pregnancy and other PK changes
- ✓ Confirmed or suspected (lack of GRTs) previous selection of resistance mutations (e.g. M184V , INI-R)
- ✓ Subjects at risk of low adherence

Conclusions

- ✓ TAF/TDF (along with FTC) has been considered as a milestone in the evolution of HAART, allowing highly forgiving regimens
- ✓ In the era of increasing use of 2DRs without TAF/TDF , TAF-based 3DRs, however, remain a gold standard in different clinical scenarios
- ✓ In vitro, 3DRs confirmed to be more forgiving as compared to 2DRs, therefore forgiveness of these regimens need to be comparatively evaluated in the clinical setting
